
BOARD AND EXECUTIVE DECISION BRIEF

MONTREAL.AI x GoalOS

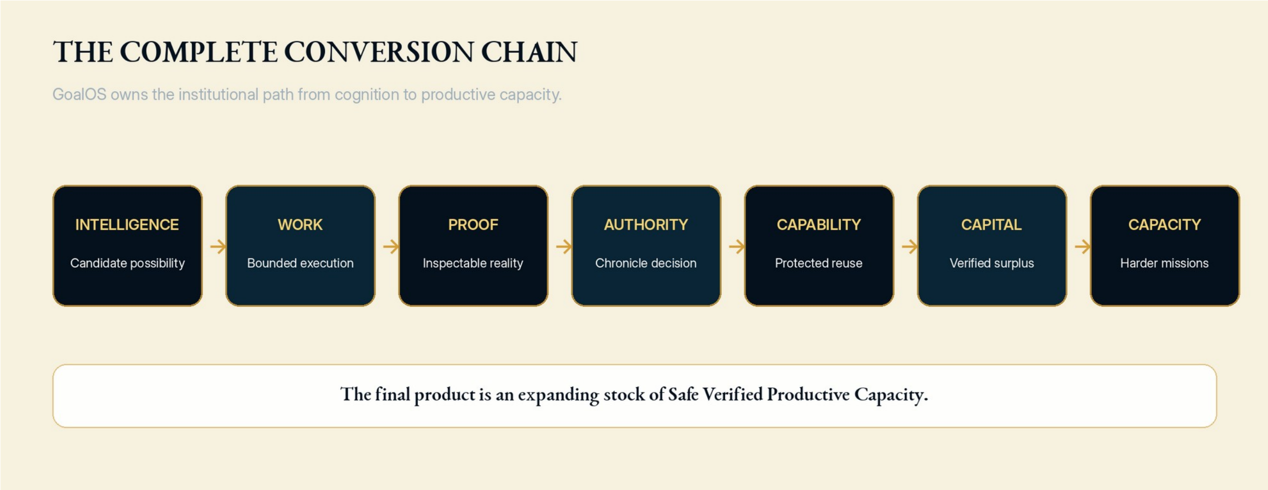
The institution that turns intelligence into proof, proof into protected capability, protected capability into recurring economic power, and verified surplus into a larger future.

Executive decision

DECISION

GO - at category-defining scale. Build for strategic importance measured in decades; launch through one bounded, paid, falsifiable enterprise wedge; let proof progressively authorize every larger claim.

The opportunity is not to build another interface to intelligence. The opportunity is to own the institutional conversion chain that becomes indispensable as machine work grows longer, more autonomous, more valuable and more deeply connected to real systems.

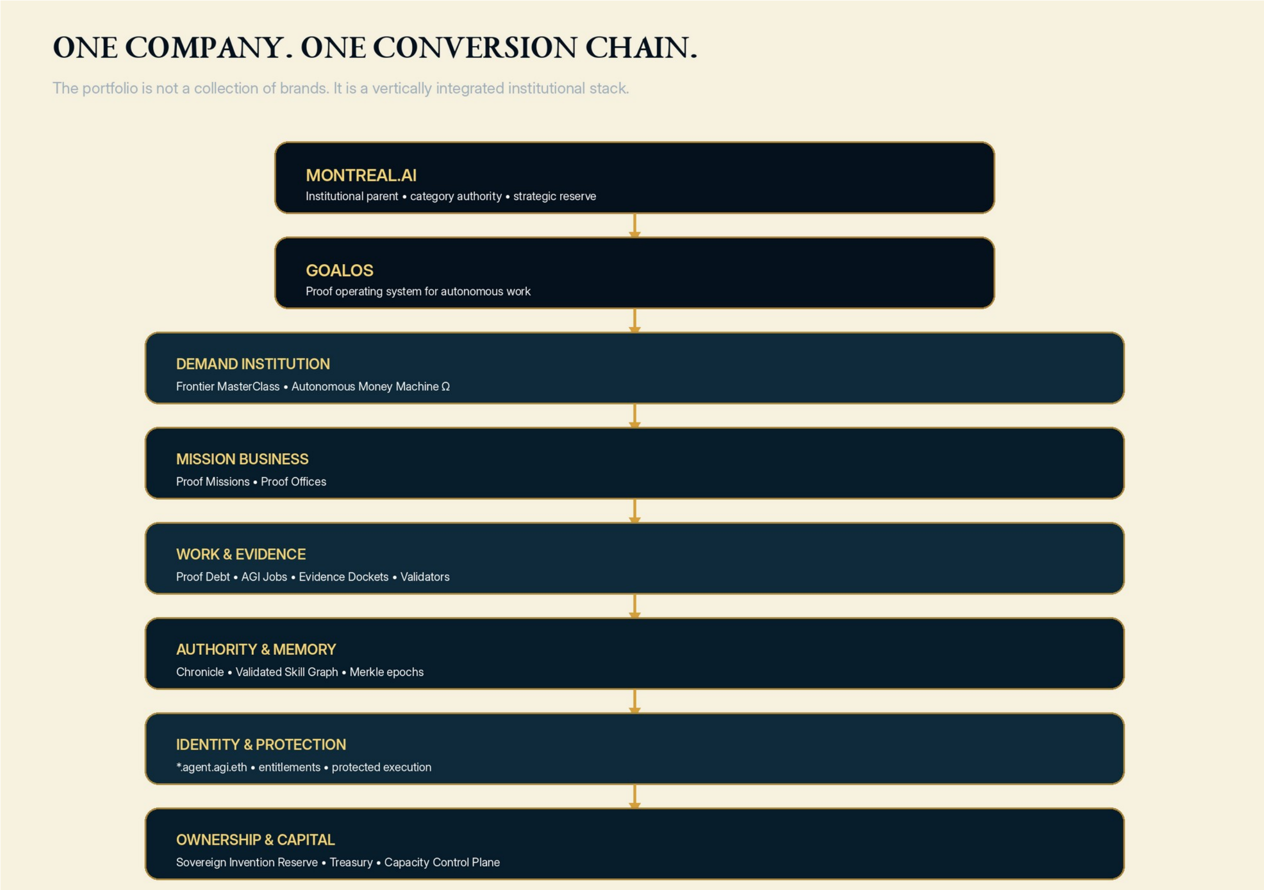


GoalOS owns the path from candidate intelligence to increasing productive capacity.

Why this window matters

- Long-running agent work is becoming a standard product primitive. The differentiating layer moves upward from execution into objectives, permissions, evidence, validation, memory, rights and rollback.
- Evaluator-driven systems are already producing bounded, measurable improvements. The scarce institutional question is no longer whether a candidate can be generated, but whether it deserves authority, propagation and capital.
- AI spending is moving toward infrastructure scale. The strategic winner will not merely produce intelligence; it will convert intelligence into governable, economically justified and physically supportable capacity.
- Enterprise adoption remains constrained by proof, identity, permissions, economics, data readiness and reliable institutional memory. GoalOS is designed around precisely those missing controls.

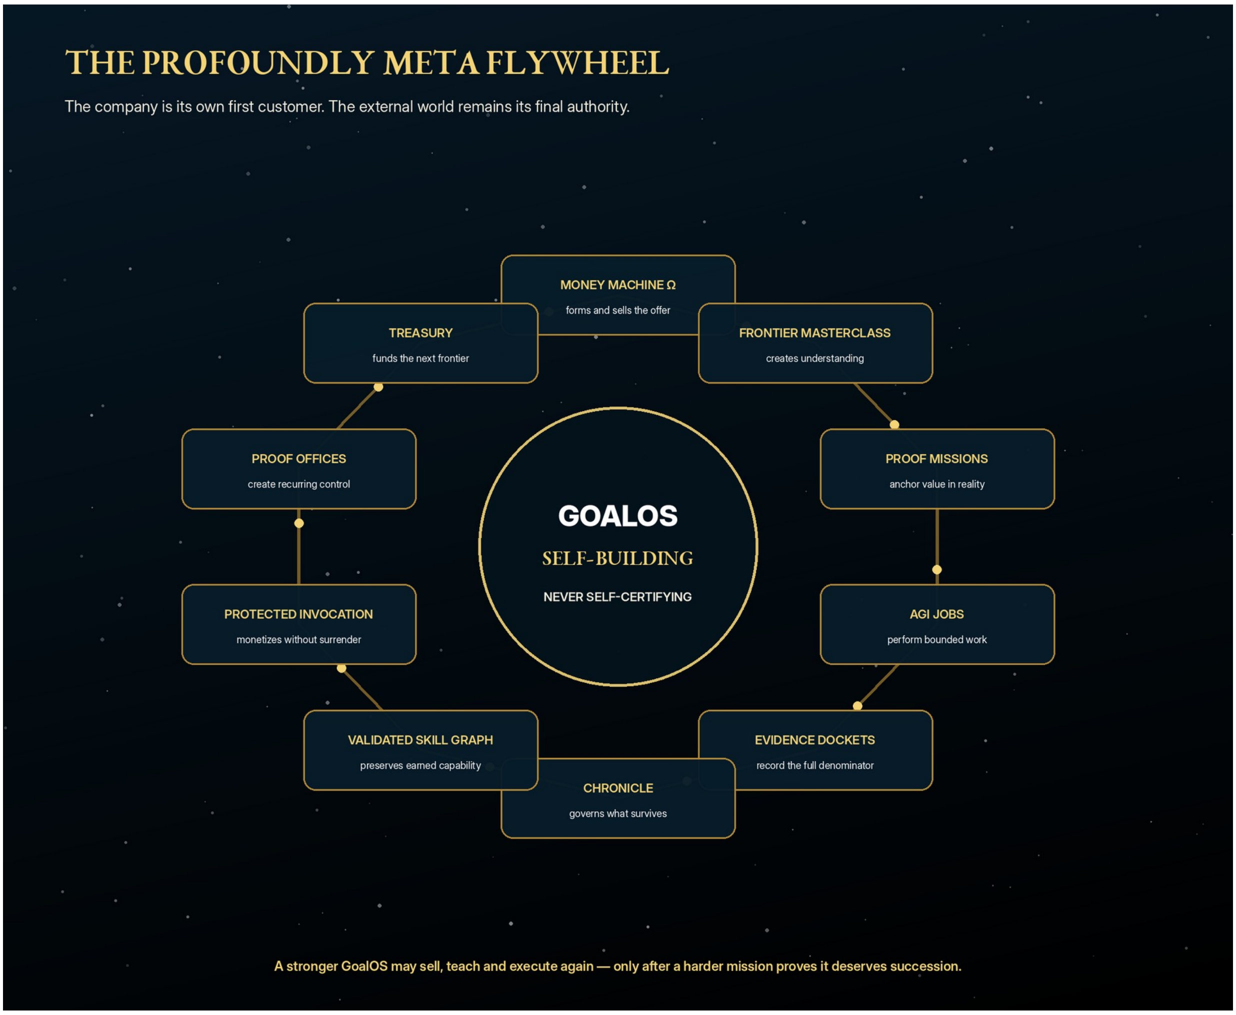
What MONTREAL.AI is building



One company and one vertically integrated institutional stack.

GoalOS is the master product and operating system. Proof Missions are the first high-value enterprise purchase. Proof Offices convert accepted missions into recurring institutional control. Everything else strengthens the same conversion chain: demand, bounded work, evidence, authority, memory, identity, protected capability and capital allocation.

The profoundly meta structure



The company is its own first customer. Reality is its final authority.

INSTITUTIONAL DISTINCTION

GoalOS may sell GoalOS, teach GoalOS, execute GoalOS and generate the next GoalOS. It may not certify its own success. Collected payment, customer action, inspectable evidence, independent review and fresh successor performance provide the external anchor.

Premium commercial architecture

Product	Initial pricing hypothesis	Strategic role
Frontier Executive MasterClass	$75,000	Category creation and qualified consequential objectives
Proof Mission Activation	$50,000	Near-zero-cost mission architecture and value case
GoalOS Proof Mission	$250,000	Decision-grade execution, Evidence Docket and governed outcome
GoalOS Proof Office	$1,000,000 per year	Recurring control, evaluation, Chronicle and capability lifecycle
Private Enterprise Network	$3,000,000+ per year	Dedicated protected capability platform and integrations
Strategic / Sovereign Deployment	$20,000,000+	Cross-institutional programmes and productive capacity

The pricing principle is value, not compute cost. A standard first-year customer architecture of Activation + Mission + Proof Office + usage is modeled at $1.55 million, 80% gross margin and a conservative four-times value-to-fee floor. These figures are hypotheses to be tested, not promises.

Illustrative capital-to-capacity scenario

Metric	Year 1	Year 5	Year 10
Revenue	$2.2M	$341M	$9.63B
EBITDA	($1.7M)	$123M	$5.08B
Recurring + usage mix	25%	80%	91%
Active Proof Offices	0.75	100	1,300
Chronicle-admitted capabilities	1	300	7,500

SCENARIO BOUNDARY

The ten-year model is an architecture of scale, not a forecast. The purpose is to make the strategic mechanics explicit: premium enterprise value, recurring Proof Offices, protected invocation, network fees, disciplined capital formation and productive-asset investment.

Commercial Proof Run 001 - the next 90 days

Gate	Required result
Paying demand	3 unrelated customers purchase the same bounded mission
Delivery	3 substantially identical missions and 3 Evidence Dockets
Authority	At least 1 independently verified customer outcome
Retention	At least 1 repeat, renewal or expansion
Capability	At least 1 rights-cleared Chronicle-admitted capability
Successor	At least 1 fresh preregistered improvement test
Economics	Positive attributable contribution margin
Trust	0 material trust breaches

The dual mandate

EXTERNALLY

Launch the proof-governed intelligence institution for the era of consequential machine work. Present world-class design, enterprise-grade engineering, serious security, canonical identity, protected execution and category ownership.

INTERNALLY

Close three customers. Deliver the same mission. Verify one outcome. Earn one repeat. Admit one transferable capability. Prove that it improves the next mission. No skipped gates.

Final judgment

Build GoalOS as though it may become one of the most valuable institutions in the future economy. Launch it as the market's most disciplined paid proof mission. Let every accepted mission make the institution more useful, defensible and capable.

Selected sources and evidence boundary

External sources establish the timing context. GoalOS pricing, revenue, ROI, financing, valuation and capacity scenarios are management hypotheses until verified by customer and operating evidence.

CLAIM BOUNDARY

This document does not claim achieved general intelligence, unrestricted recursive improvement, guaranteed customer outcomes, legal certification, audited forecasts, or a present enterprise valuation. The governing doctrine is maximum ambition with minimum unsupported claim.
