

MONTREAL.AI × GOALOS

STRATEGY & FINANCIAL MEMORANDUM

The Optimal GoalOS Business Model

Strategy, economics, operating architecture, proof gates and five-year management case.

Build the customer outcome first. Let every accepted mission create the platform.

Memorandum

To	From	Date	Subject
MONTREAL.AI Board, leadership and strategic partners	GoalOS Strategy Office	20 July 2026	The Optimal GoalOS Business Model

1. Executive summary

GoalOS should operate as a Proof Utility: a vertically integrated institution that converts expensive uncertainty into bounded missions, inspectable evidence, governed decisions, recurring institutional control and protected reusable capability.

The temporary arbitrage is the Capability–Price Lag. The enduring company is the private, rights-cleared network of capabilities that repeatedly produced verified outcomes—and can be invoked without surrendering the implementation.

The optimal starting offer is a near-zero-marginal-cost Proof Mission Activation priced by the decision value it structures. The Activation expands into a paid Proof Mission, then a recurring Proof Office. Successful mission methods become candidate skills; Chronicle admits only what passed; the Validated Skill Graph preserves scope, evidence, rights, versions, failure history and transfer performance; protected invocation creates software-like margins.

FY1 REVENUE	FY3 REVENUE	FY5 REVENUE	FY5 EBITDA	FY5 RECURRING + USAGE
\$1.4M	\$16.6M	\$94.2M	\$45.1M	87%

2. The economic dislocation: the Capability–Price Lag

AI has repriced cognitive production faster than organizations have repriced cognitive work. Candidate research, analysis, plans, proposals, presentations, code and documentation can now be produced dramatically faster and at extremely low inference cost. Yet enterprises still pay for trust, context, authority, integration, liability, evidence and outcomes. [S1–S6]

Old Mode	Early AI Mode	GoalOS Mode
Human labor, meetings and static deliverables	Cheap and persuasive candidate output	Verified outcome plus a system that keeps the outcome current

Old Mode	Early AI Mode	GoalOS Mode
Pricing tracks hours and team size	Pricing collapses toward generation cost	Pricing tracks conservative value at stake and risk retired
Knowledge disappears into documents	Output is abundant but ungoverned	Accepted capability becomes scoped, versioned and reusable
One-off engagement	Commodity generation	Recurring Proof Office and protected capability invocation

The business must not sell a one-dollar AI artifact for two dollars. It should sell a bounded decision or institutional function whose economic value remains large—while retaining very high gross margins because most production is standardized and autonomous.

3. The initial wedge and ideal customer

The recommended beachhead is AI Trust & Revenue: organizations with an important AI deployment, vendor claim, enterprise contract, procurement path, investment or compliance burden whose progress is blocked by insufficient proof.

Qualification dimension	Required state
Consequence	At least \$250K of contract, deployment, capital or risk value at stake
Authority	Named sponsor with budget and decision rights
Timing	Decision deadline within 90 days
Evidence	Digital inputs can be securely supplied; acceptance criteria can be frozen
Economics	Conservative value pool normally at least 4× first-year fee
Recurrence	Ongoing monitoring, claim freshness, governance, RFP, audit or capability need
Rights	Explicit mission-only, customer-private, network-admissible or sector-exclusive treatment

4. The product and revenue architecture

The Optimal GoalOS Economic Conversion Chain

Diagnose almost for free | price by value | prove one consequential outcome | turn the outcome into recurring control | protect and monetize accepted capability.

Product	Customer outcome	Initial pricing hypothesis	Strategic function
Proof Readiness Scan	Initial diagnosis, Proof Debt and value-at-stake estimate	Free–\$495	Acquisition and self-selection
Proof Mission Activation	Mission Contract, claims matrix, evidence plan, ROI case	\$15,000	Near-zero-cost paid front door
GoalOS Proof Mission	Executed, reviewed and decision-grade outcome	\$50,000–\$150,000	Customer proof and capability creation
GoalOS Proof Office	Continuing evidence, governance, Chronicle and executive control	\$15,000–\$50,000/month	Recurring enterprise relationship
Private Enterprise Network	Dedicated integrations, protected runtime, private graph and managed review	\$250,000–\$1M+/year	Platform-scale revenue and switching costs
Protected Capability Invocation	Governed reuse of private Chronicle-admitted capability	Usage based	90%+ mature gross margin
AGI Jobs / Validator Network	Bounded work and independent review coordination	10–20% network fee	Transaction and ecosystem economics

5. Pricing doctrine

GoalOS should calculate two prices and use the higher one:

Value-based price = 5–15% of conservative attributable customer value.
Margin-floor price = expected variable cost ÷ (1 – required gross margin).

Example: if a mission costs \$18,750 to deliver and requires a 75% gross margin, the minimum price is \$75,000. If the conservative value is \$1M and the value-based target is 10%, the quoted price is \$100,000—subject to scope, assurance and risk.

- No measurable value pool, no standard offer.
- No margin floor, no quote.
- No approved clause path, no contract.
- No collected payment, no capacity reservation.
- No frozen acceptance criteria, no execution.
- No verified continuing need, no renewal.

6. Unit economics and customer ROI

Complete first-year relationship	Revenue	Direct cost	Gross profit
Proof Mission Activation	\$15,000	\$500	\$14,500
Proof Mission	\$75,000	\$18,750	\$56,250
Proof Office	\$216,000	\$43,200	\$172,800
Protected capability usage / validation	\$25,000	\$2,500	\$22,500
Total	\$331,000	\$64,950	\$266,050

Illustrative gross margin is 80.4%. At \$1.2M of attributable customer value, illustrative customer ROI is 262.5%. GoalOS must separately track forecast value, independently supported value and realized cash value; projections may never be presented as outcomes.

7. The autonomous commercial institution

The standard commercial lane should remove seller-side human intervention. The customer still chooses, consents, signs, pays, supplies inputs and accepts or disputes the result. GoalOS operates inside a counsel-approved, security-reviewed commercial constitution.

Commercial state	Autonomous action	Hard gate
Intent detected	Permissioned demand and Readiness Scan	No provable permission, no outreach
Qualified	Validate sponsor, deadline, value, risk and data readiness	No consequential objective, no offer
Priced	Select fixed product, scope, assurance and delivery window	No margin floor, no quote
Contracted	Generate approved SOW, DPA, terms, payment and capacity reservation	Outside clause matrix → reprice, reduce or decline
Funded	Instantiate Mission Contract and Evidence Docket	No cleared payment, no execution
Delivered	Evidence, independent review and acceptance	No Docket, no value claim

Commercial state	Autonomous action	Hard gate
Recurring	Activate Proof Office and evidence-based renewal	No verified need, no renewal
Improved	Test commercial methods on held-out cohorts	No positive contribution and retention, no skill admission

8. Proof Mission delivery system

1. Freeze the objective, scope, authority, budget, evidence standard, rights and rollback conditions.
2. Convert unsupported claims and uncertainty into a Proof Debt Register.
3. Decompose the mission into bounded AGI Jobs with workers, validators, budgets, tests and terminal states.
4. Capture sources, actions, costs, failures, retries, interventions and contradictions by construction.
5. Route material claims through deterministic tests, separated evaluators and customer acceptance.
6. Issue a governed decision: accept, condition, repair, reject, quarantine, supersede or stop.
7. Propose candidate skills only from accepted work; preserve no raw output as canonical capability.
8. Convert ongoing obligations and unresolved Proof Debt into the recurring Proof Office plan.

9. Chronicle, the Validated Skill Graph and protected invocation

The durable moat is not the model, prompt or graph database. It is the accumulated, rights-controlled history of customers, sponsors, missions, evidence, evaluators, failures, repairs, Chronicle decisions, successful reuse, renewals and economic performance. [S10–S11]

Only current direct GoalOS agent identities with valid, scoped, revocable entitlements may invoke Chronicle-admitted, root-verifiable private capabilities—and the implementation never has to leave MONTREAL.AI's protected execution boundary.

Rights class	Learning / reuse right	Price treatment
Network-admissible	Anonymized, generalized capability may be admitted after proof and rights review	Base price
Customer-private	Reusable only for the originating customer	+25–50%
Sector-exclusive	Defined field or time-limited exclusivity	+100–300%
Mission-only	No capability extraction or reuse	Highest delivery price

10. Five-year management case

The workbook accompanying this memorandum is fully editable. The base case intentionally moves revenue from missions toward Proof Offices, private networks, protected invocation and network fees.

\$ millions	FY1	FY2	FY3	FY4	FY5
Revenue	1.4	5.8	16.6	40.6	94.2
Gross profit	1.1	4.6	13.6	34.1	80.1
Gross margin	79%	80%	82%	84%	85%
EBITDA	(1.3)	0.1	4.9	15.6	45.1
Ending cash	0.6	1.3	7.0	15.8	43.1
Recurring + usage mix	38%	56%	72%	81%	87%

This is not a forecast. It is an explicit hypothesis whose assumptions must be updated from commercial receipts, actual costs, conversion, retention, independent-review burden and protected-invocation economics.

11. Capital plan and evidence gates

Gate	Capital use	Evidence required
Commercial Proof Run	\$250K initial envelope	3 paying customers; 1 reviewed outcome; 1 repeat; positive contribution; 1 capability
Productization	\$0.75M-\$1.5M cumulative	Repeatable lane; several Offices; declining founder hours; security plan
Enterprise platform	\$3M-\$5M cumulative	10-20 customers; recurring contracts; private execution; transfer evidence
Network scale	Growth capital tied to adoption	External agents/evaluators; substantial usage; strong retention; category leadership
Productive infrastructure	Ring-fenced project / strategic finance	Verified free cash flow; independently measured capacity gain; explicit stop conditions

12. Go-to-market sequence

1. Use the Frontier MasterClass and founder distribution to create category understanding and permissioned demand.
2. Let the Proof Readiness Scan expose the buyer's Proof Debt and value at stake before asking for a transaction.
3. Sell a fixed Activation with 100% prepayment and 24–72-hour delivery.
4. Convert qualified Activations into one standard Proof Mission with fixed scope and milestone billing.
5. Convert successful missions into annual Proof Offices with evidence-based renewal.
6. After repeated transfer, expose selected capabilities through protected invocation and private enterprise networks.
7. Only after network proof, open AGI Jobs, validator and entitlement economics more broadly.

13. Operating team and separation of powers

Role	Primary mandate
Founder / Category Architect	Category, capital, strategic partners and constitutional doctrine
Commercial Institution Lead	Autonomous demand, transaction, unit economics and expansion
CTO / Runtime Lead	Models, tools, environments, protected execution and integrations
Chief Evidence Officer	Evidence Dockets, evaluators, replay and outcome measurement
Security & Identity Lead	Entitlements, keys, isolation, root verification and incident response
Customer Mission Lead	Mission quality, acceptance, recurring conversion and rights
Independent Review Council	Separated authority for material claims, admission and falsification

14. Governing scorecard

Metric	Target gate
Conservative customer value / first-year fee	≥4.0×
Activation gross margin	≥95%
Proof Mission gross margin	70–80%
Proof Office gross margin	≥80%
Protected invocation gross margin	≥90%
Mission-to-Office conversion	≥40%
CAC payback	<6 months
Mature net revenue retention	≥120% target
Unsupported material commercial claims	0
Founder seller minutes / standard transaction	0
Revenue powered by reused capability	≥30% by Year 2 target
Successor promotion without fresh testing	0

15. Falsification and stop conditions

- Fewer than three paid Activations from thirty highly qualified prospects: repair the wedge before broad build.
- Fewer than 30% of successful Proof Missions convert to continuing control: treat the business as services and redesign recurrence.
- Reused capabilities fail to improve cost, time, risk, evidence or reviewer burden by at least 15–20%: do not claim compounding capability.
- Human labor remains most of direct cost after repeated delivery: the process is not yet productized.
- The system cannot separate execution, evaluation and Chronicle authority: block high-consequence autonomy.
- A material privacy, evidence, authorization or trust breach occurs: pause expansion and enter incident Proof Mission.

16. Definitive recommendation

Diagnose almost for free. Price according to value. Prove one consequential outcome. Turn the outcome into recurring control. Turn accepted experience into protected capability. Charge repeatedly for governed reuse. Reinvest only verified free cash flow.

The first commercial atom is not a universal platform. It is one purchased mission architecture, one paid execution, one Evidence Docket, one independent review, one recurring relationship and one fresh mission that improves because an admitted capability exists. Repeat that sequence, and the business progresses from service to software, from software to protected capability network, and from network to institutional infrastructure.

Selected sources and claim boundary

External sources support market timing, technical feasibility, pricing context and comparative benchmarks. All GoalOS prices, volumes, margins, ROI, financing and valuation paths are editable management hypotheses—not audited forecasts, realized results, legal advice, investment advice, security certification or guarantees.
