

GOALOS

Partner MASTERCLASS

SOVEREIGN EDITION

The institution that makes intelligence earn authority.

Mission 1 must not merely be remembered. It must earn the right to make Mission 2 better.

18 MODULES · INTERACTIVE · RSI · REAL-TASK EVIDENCE

Vincent Boucher
President, QUEBEC.AI & MONTREAL.AI

EXECUTIVE PROPOSITION

AI capability is abundant. Institutional permission to rely on it is not.

GoalOS converts autonomous work into proof-carrying, replayable, rollback-ready institutional capability.

MODELS

Candidate output

Text, code, plans, hypotheses, tool proposals.

AGENTS

Bounded action

Tools, environments, search, execution.

GOALOS

Earned authority

Proof, validation, memory, settlement, challenge, rollback.

INSTITUTION

Durable capability

Scoped reuse, cryptographic state, measurable Mission 2 lift.

Discovery engines improve results. GoalOS governs the right to evolve.

ROLE-ADAPTIVE EXPERIENCE

One institution. Seven partner lenses.

The masterclass changes its language, value thesis, entry path, and proof metric for the person in the room.

Bring one consequential objective, one executive sponsor, and one independent reviewer.

THE AUTHORITY GAP

What most AI platforms still cannot answer.

The missing layer is not generation. It is an evidentiary constitution for reliance.

What was authorized?

What was attempted?

What proof exists?

Who replayed it?

What failed?

What remains risky?

What may be reused?

How is it revoked?

A prompt requests an answer. A proof loop decides what must be proven before the answer can matter.

CANONICAL OPERATING LOOP

Objective → proof → governed capability → better future mission.

Authority advances only when evidence survives the next gate.

AUTHORITY STACK

Desire, work, evidence, memory, and commitment remain separate.

No lower layer may silently bypass the gate above it.

- 01 Objective** Intent, decision, success, failure
- 02 Mission** Scope, proof level, budget, risk, rollback
- 03 Proof Work** Claims, Proof Debt, custom jobs
- 04 Evidence** Bundles, provenance, replay, cost, risk
- 05 Memory** Chronicle, scope, version, utility
- 06 Commitment** Roots, signatures, ZK receipts, lineage

MISSION OS

Set the objective. GoalOS runs until proof is done.

The flagship deliverable is a Governed Decision State—not a static report.

Mission Contract	Claims matrix	Source provenance	Contradiction register
Evidence Docket	Verifier report	Risk ledger	Executive brief
Decision deck	Action graph	Chronicle entry	Capability package

The shortest path from uncertainty to justified action.

MISSION CONTRACT

Freeze the institutional boundary before agents optimize the work.

Objective, proof level, risk, validators, blocked claims, and rollback become explicit.

```
{
  "objective": "Authorize a bounded AI deployment?",
  "proof_level": "L3 External Review",
  "risk_class": "High",
  "required_validators": [
    "independent reviewer", "AGI Node council"
  ],
  "blocked_claims": [
    "guaranteed ROI", "unrestricted autonomy"
  ],
  "rollback": ["quarantine", "revoke on root mismatch"]
}
```

- Prevents ambiguous optimization
- Makes success and failure falsifiable
- Calibrates validator burden
- Protects private intelligence
- Blocks claims before proof
- Defines Mission 2 metric
- Makes rollback mandatory

PROOF FACTORY

Unsupported claims become explicit work—not hidden assumptions.

The job factory starts empty and creates only mission-specific proof contracts.

An AGI Job is a proof contract—not a todo item.

EVIDENCE DOCKET

A proof room that lets a reviewer reconstruct the mission.

What happened, what failed, what remains blocked, who can replay, and what may be reused.

24

artifacts

8

supported claims

4

blocked claims

3

contradictions

6

replay manifests

2

rollback paths

Evidence must become inspectable before it becomes authority.

AGI NODE VALIDATION COUNCIL

Independent commit-reveal validation at global scale.

Nominal identities do not count as independent when one operator, model, cloud, or key controls them.

Five labels ≠ five independent validators.

CHRONICLE

The memory firewall between evidence and durable capability.

Admit, admit with scope, repair, reject, quarantine, supersede, revoke, or retire.

VALIDATED SKILL GRAPH

Governed capability memory—not a prompt library.

A durable skill carries scope, method, evidence, tests, validators, risk, version, freshness, utility, and rollback.

MERKLE, PRIVACY, AND ZK

Commit exact institutional state without publishing plaintext private intelligence.

Chronicle decides authority. Merkle roots preserve the state that earned it.

Inclusion is not truth. A root is a commitment layer; Chronicle is the authority layer.

BONDED AUTHORITY

\$AGI ALPHA becomes professional protocol security behind consequential transitions.

Nearly invisible user friction; capital at risk whenever work asks to become paid, trusted, challenged, reusable, or promoted.

Begin work

Worker Proof Bond

Become paid

ProofBundle + Validator Bonds

Become trusted

Claim Authority Bond

Open challenge

Challenger Bond

Become reusable

Capability Reuse Bond

Operate node

Node Operational Reserve

Upgrade GoalOS

Proposal + Canary + Rollback

0% PROTOCOL TRANSFER TAX

\$0 TREASURY TARGET

RSI SOVEREIGN INVENTION LAB

Recursive self-improvement as deterministic, auditable institutional state transition.

Artifacts are schema-bound, baselines are mandatory, ledgers are append-only, and promotion is mechanically gated.

SEARCH CONTROL ≠ OUTCOME AUTHORITY

Exploration can be open-ended. Promotion cannot.

OMNI or any search controller may allocate attention and compute; it never grants memory, settlement, or rollout authority.

SEARCH / ALLOCATION

- Interestingness
- Novelty
- Diversity
- Stepping stones
- Resource allocation
- Candidate generation

OUTCOME AUTHORITY

- Risk gate
- Evidence contact
- Baseline advantage
- Reproduction
- Stress + persistence
- Scope + rollback

A high score cannot bypass a hard gate.

MOVE-37 BREAKTHROUGH CONTROL

High novelty creates a higher burden of proof.

Breakthroughs are admitted as audited state transitions—not as narratives.

- 1 Recognize** Thresholds + risk + ECI
- 2 Reproduce** Fixed seeds + baseline + hashes
- 3 Stress-test** Policy shocks + sensitivity
- 4 Persistence** Advantage remains positive
- 5 Dossier** Scope + evidence + rollback

HIGH NOVELTY
⇒
HIGHER SKEPTICISM

No probe, no breakthrough claim.
No persistence, no promotion.

CONSTITUTIONAL SELF-HOSTING

GoalOS may improve GoalOS only through GoalOS.

No privileged developer exception. Every constitutional change needs evidence, canaries, monitoring, and rollback.

- Proposal bond
- Evaluator independence
- Constitutional invariants
- Delayed outcomes
- Rollback target
- New graph epoch

No proof, no evolution. No eval, no propagation. No rollback, no release.

THE DECISIVE MISSION 1 → MISSION 2 TEST

Mission 1 must make fresh Mission 2 work measurably better.

Equal model, tools, time, compute, evaluator, stopping rule, and context budget. Only the prior differs.

Fresh control

No prior capability

Raw memory

Transcript / notes

Validated Skill

Chronicle-admitted capability

Ungated candidate

Rejected or unreviewed memory

Validated Skill > Raw Memory > Fresh Control; ungated memory must not silently propagate.

INTERACTIVE TRANSFER RESULT

The mechanism passes inside the partner simulation.

A rejected prior harms performance; tampering revokes inherited authority.

Fresh Control

External independent replay remains a separate gate.

REAL-001 EVIDENCE ROOM

A consequential public software-maintenance transfer case.

A validated repository-reliability skill reached the correct safe decision with less evidence-search effort.

PARTNER VALUE ARCHITECTURE

Reduce proof debt, failure exposure, review latency, and reinvention.

Increase decision readiness, validator confidence, and reusable governed capability.

\$30.7M

missions receiving validated capability

$$\text{Mission Value} = \frac{\text{Decision impact} \times \text{Proof integrity} \times \text{Actionability} \times \text{Reuse}}{\text{Cost} + \text{Risk} + \text{Latency} + \text{Proof Debt}}$$

Scenario model—not a forecast, valuation guarantee, or financial recommendation.

PARTNERSHIP PATHWAYS

Start with a proof mission. Compound into infrastructure.

Each step is a building block for the next.

01	Proof Mission Sprint	One consequential objective → Governed Decision State
02	Enterprise Proof OS	Install proof levels, Chronicle, replay, rollback, and skill memory
03	Private VSG	Govern reusable capability across sensitive institutional work
04	Managed AGI Node Council	Independent validation, replay, identity, and assurance
05	Cross-Institution Proof Network	Portable proof-bearing capability without plaintext leakage

PARTNER INTEGRATION ARCHITECTURE

GoalOS sits above existing capability and below institutional consequence.

THIRTY-DAY PARTNER PILOT

One objective. One sponsor. One independent reviewer. One Mission 2 test.

The pilot earns the right to expand; it does not predeclare success.

WEEK 1

Freeze authority

Mission Contract, proof level, claim boundary, baseline, privacy, rollback.

WEEK 2

Produce proof

Custom jobs, bundles, provenance, contradictions, cost and risk.

WEEK 3

Validate + challenge

Independent replay, AGI Nodes, falsification, Chronicle recommendation.

WEEK 4

Deliver + transfer

Decision State, Skill Passport, Merkle packet, Mission 2 comparison.

The pilot's final deliverable is a measured authority transition—not a presentation.

TRUST, DUE DILIGENCE, AND CLAIM BOUNDARY

Sophisticated partners trust systems that state exactly what is evidenced and what remains open.

Evidence maturity is part of the product.

Mission Contract

Evidence Docket

UNPROVEN
NOT GRANTED

No label overrides facts. No token creates immunity. No code overrides mandatory law.

THE PARTNER ASK

Bring one consequential objective.

Leave with proof — and the first capability that has earned the right to make the next mission better.

AI creates output. GoalOS creates proof. The institution decides what earns memory.

Vincent Boucher · President, QUEBEC.AI & MONTREAL.AI
