

AGI JOBS × OPENAI GYM × SUCCESSOR Ω

Board and Executive Brief - Evidence-and-Institution Edition

The board-level constitution for bounded work, adaptive mission training, fresh proof and accountable
Successor Ω authority

Board declaration

The board is not being asked to approve “more AI.” It is being asked to decide whether one consequential mission should receive a bounded job constitution, a Sovereign Mission Gym, a competing architecture portfolio, protected fresh proof and—only if one candidate wins—a scoped Authority Envelope.

Vincent Boucher

President, MONTREAL.AI & QUEBEC.AI

OpenAI Gym denotes the historical algorithm–environment interface lineage. Maintained reference environments use Gymnasium-compatible APIs. This independently authored framework does not imply an official OpenAI product relationship.

1. The board decision

AGI Jobs define the bounded work. The OpenAI Gym lineage mission environment manufactures experience and exposes failure. Specialist ASI is earned only after one exact complete candidate wins on protected fresh work. Successor Ω is that proven institution after accountable admission and the grant of bounded authority.

AGI Jobs	Objective, principal, identity, inputs, tools, prohibitions, budget, evidence, verifier, acceptance, rollback and Chronicle eligibility.
OpenAI Gym	State, observations, actions, transitions, rewards, hard constraints, scenario distributions, proof receipts, termination and truncation.
Specialist ASI	Earned comparative proof state across capability, economics, reliability, sovereignty, governance and transfer.
Successor Ω	Specialist ASI after accountable admission, with mission identity, Authority Envelope, Chronicle, monitoring, expiry and rollback.

Economic doctrine

Beta is rented. The Spread is underwritten. Alpha is the residual mission surplus remaining after complete cost, risk, human burden, dependency, Proof Debt and Gym-to-reality basis risk are counted.

2. The manufacturing progression

Mission Constitution → Typed Job Graph → Alpha Foundry → Formation Gym → Exact Release Freeze → Fresh Proof → Specialist ASI → Accountable Successor Ω Admission.

The progression is discontinuous. AGI Jobs compile work. The Formation Gym manufactures experience. Algorithms improve candidates. Fresh proof creates a verdict. Accountable admission creates authority.

3. The board's non-negotiable firewalls

- Producer ≠ Verifier ≠ Admitter.
- Formation Gym ≠ Fresh-Proof Plane.
- Access ≠ Authority.
- Execution ≠ Acceptance ≠ Chronicle admission.
- Capability improvement ≠ Authority expansion.
- Job permissions do not compose into successor authority.
- Descendants inherit neither proof nor authority.

4. Algorithm portfolio, not algorithm faith

The Sovereign Alpha Foundry routes a portfolio according to mission structure. It may test deterministic rules, behaviour cloning, offline RL, PPO, SAC, MuZero-style planning, world models, multi-agent coordination, MAP-Elites, human-machine workflows or retention of the incumbent.

Selection rule

The winner is the simplest constitutionally admissible complete architecture with the highest conservative proven Mission Alpha. MuZero is one competitor, not the presumed successor.

5. What fresh proof must establish

- one exact frozen release ;
- unseen production-representative cases ;
- matched comparison against incumbent and best alternative ;
- zero critical failures above the mission ceiling ;
- zero unauthorized actions ;
- sufficient evidence, reliability, governance, sovereignty and transfer ;
- complete cost and human burden ;
- Gym-to-reality basis-risk reserve ;
- rollback and degraded-mode readiness.

6. Synthetic reference evidence

The disclosed SJX-5 benchmark contains five mission families, seven candidate architectures and 28,000 synthetic case records. Deterministic Rules win Invoice Integrity ; MuZero/World Model wins Building Operations ; Sovereign Hybrid wins Grid Resilience, Verified Software and Acquisition Underwriting. The conclusion is not that any one method is universally superior. It is that mission structure, complete burden, hard gates and Gym-to-reality reserve determine the winner.

7. Job-Graph governance

The board should require three explicit edge types : evidence edges, control edges and invalidation edges. It should also identify critical cut sets, predecessor expiry, Proof-Debt propagation and the exact actor who may underwrite, execute, accept, admit and allocate. A completed Job Graph creates formation completeness, not mission dominance.

No authority by union

The union of AGI Job permissions is never the Successor Ω Authority Envelope. Authority is separately issued from fresh evidence, mission risk, rollback readiness and accountable admission.

8. Authority ladder

A0 Observe → A1 Recommend → A2 Sealed Sandbox → A3 Reversible Bounded Action → A4 Consequential Action.

A candidate may prove mission dominance at A1 and remain ineligible for A3 or A4.

9. The first 90 days

Days 1–15	Freeze mission, incumbent, alternatives, constraints, rights, proof capital and authority ceiling.
Days 16–30	Compile the Job Graph, data rights and replay environment ; reproduce the incumbent.
Days 31–45	Build candidate architectures, producer/critic/verifier roles and proof receipts.
Days 46–60	Run formation, adversarialize, test rollback and freeze one exact challenger.
Days 61–75	Execute independent fresh proof and complete-denominator accounting.
Days 76–90	Decide promote, retain, repair, reserve, hedge, reject or stop ; if admitted, begin shadow/canary operation.

Board conclusion

Select one narrow, valuable, repeated and proofable mission. Compile sealed AGI Jobs. Own the Gym. Compete several complete successors. Freeze one challenger. Purchase fresh proof. Grant only bounded authority. Preserve the result and its failures so the next succession is faster and stronger.
