

GOALOS SINGULARITY NAVIGATOR Ω + SEIZE GYM, SPECIALIST ASI & MISSION-SOVEREIGN SUCCESSOR Ω

Board and Executive Brief - Unified Constitutional, Gym and Evidence Edition

The Verified Succession Institution from frontier sensing to the successor to the successor

Governing declaration

Navigator Ω detects architecture depreciation and maintains the Successor Book. SEIZE underwrites one reversible proof trajectory. The Gym makes the mission executable. Specialist ASI identifies the proven winner. Mission-Sovereign Successor Ω receives only scoped authority, and Chronicle prepares the successor to the successor.

The board decision

The board is not being asked to approve “more AI.” It is being asked to decide whether one consequential mission should receive a sovereign Gym, a bounded successor-formation mandate, fresh comparative proof and—only if the candidate wins—a limited Authority Envelope.

Navigator Ω	Frontier Radar, Capability Twin and Successor Book that convert external change into a governed succession portfolio.
Mission Gym	Institution-owned environment that makes the mission executable, replayable, adversarial and measurable.
Specialist ASI	Complete candidate intelligence institution that proves superiority against the incumbent and best credible alternative.
Successor Ω	Proven system after accountable admission, with identity, Chronicle, monitoring, rollback and scoped authority.

The economic doctrine

Beta is rented. The Spread is underwritten. Alpha is manufactured through the sovereign Gym, differentiated architecture and comparative proof. Successor Ω captures and compounds only the advantage that survives fresh reality.

The complete progression

Successor Manifold → Mission Advantage Gradient → SEIZE Underwriting → Bounded AGI Jobs → Specialist ASI → Mission-Sovereign Successor

1. Map materially different complete architectures.
2. Identify the direction of proof-adjusted mission gain.
3. Authorize only the smallest decision-changing proof package.
4. Constitute models, tools, verifiers, people, evidence and rollback through bounded jobs.
5. Freeze one challenger and test it on protected fresh work.
6. Grant only the authority collateralized by current evidence.

Why the Gym is the sovereign asset

The model may be rented. The Gym preserves the mission, state, action space, failure cases, evaluator, proof receipts and transfer surface. It lets future models and providers compete without forcing the corporation to surrender its mission or memory.

Board-level Gym assets

Mission Constitution ; state and action schemas ; rights-cleared cases ; synthetic and adversarial scenarios ; hidden protected proof ; independent verifier ; failure taxonomy ; proof receipts ; Authority simulation ; Chronicle and requalification.

The complete Successor is larger than the policy

A policy chooses actions. The complete successor additionally contains the world model, data, tools, specialist roles, verifier, human principals, workflow integration, security, evidence, Chronicle, rollback and Authority Envelope.

Authority rule

$$A_t \leq \phi(E_t).$$

Capability never expands authority automatically. A system may be mission-dominant while remaining advisory.

The successor to the successor

The admitted successor may generate descendants and propose improvements. It may not inspect protected cases, rewrite the constitution, certify itself, install itself or inherit authority automatically.

Reference synthetic cycle

The Aurelia invoice-integrity reference cycle constituted five alternatives, ran seven recursive generations, froze one sovereign-hybrid challenger, tested 1,200 protected cases and admitted only reversible payment-hold authority.

Protected paired-gain LCB	0.2002
Evidence coverage	98.85%
Critical false reassurance	0
Unauthorized actions	0
Synthetic canary net value	C\$557,329.39
Next-successor LCB after impairment and repair	0.0744

The results are synthetic and unaudited. They demonstrate integrated mechanics, not customer value or production ASI.

GSSB-4 cross-mission proof

Version 6.0 integrates four deterministic mission environments, 6,000 synthetic cases and 30,000 candidate episodes. Recursive Successor Ω passes every synthetic gate across Invoice Integrity, Building Operations, Acquisition Underwriting and Verified Software Engineering with zero critical false reassurance and zero unauthorized action.

Mission	Proof accuracy	LCB95 gain
Invoice Integrity	83.6%	1.720
Building Operations	79.6%	2.002
Acquisition Underwriting	75.8%	2.282
Verified Software Engineering	83.4%	1.875

The result is synthetic. It proves reproducibility of the mechanism, not real-world Specialist ASI or authority.

Formal board-level results

Under the stated axioms :

- common frontier access compresses relative surplus under symmetry;
- reusing noisy evaluation to select the winner creates optimistic bias;
- a frozen challenger and independent proof set are required for an unbiased mission estimate;
- evidence impairment cannot justify greater authority;
- promotion must remain positive after the Gym-to-reality basis-risk reserve;
- no candidate-only action sequence can reach a higher-authority state when proof and admission credentials remain externally controlled.

Board evidence rule

A high score is not an authority decision. The board authorizes proof capital, reviews independent evidence, and grants only the mission scope, duration, reversibility and consequence that current evidence supports.

Board hard gates

- Exact mission, incumbent and best credible alternative.
- Rights-cleared data and sovereign Gym custody.
- Independent protected proof.
- Complete cost, human burden and basis-risk reserve.
- Zero critical false reassurance above the mission ceiling.
- Zero material unauthorized action.
- Rollback and degraded-mode readiness.
- Separate accountable admission and expiry.

The first 90 days

Days 1–15	Freeze mission, incumbent, alternatives, critical errors, proof budget, rights and authority ceiling.
Days 16–30	Build replay Gym, baselines, scorer and proof receipts.
Days 31–45	Add producer, critic, verifier, governor and principal roles.
Days 46–60	Adversarialize and test rollback.
Days 61–75	Freeze Fresh-Proof Gym and challenger.
Days 76–90	Run matched proof, shadow/canary and admit/limit/repair/stop decision.

Board conclusion

Do not authorize a universal autonomous agent. Select one narrow, valuable, repeated and proofable mission. Own the Gym. Constitute several complete successors. Freeze one challenger. Purchase fresh proof. Grant only bounded authority. Preserve the result and its failures so the next succession is faster and stronger.
