

# GoalOS Value Realization Dossier Ω

Three Consequential Use Cases for Proof-Governed Economic Value

GoalOS delivers strong value when a consequential objective has a real sponsor, budget, deadline, proof burden and economic cost of error.

| DECISIONS AT STAKE | EXTERNAL FEES | GROSS MODELED VALUE | PORTFOLIO ROI |
|--------------------|---------------|---------------------|---------------|
| \$37.05M           | \$325K        | \$2.82M             | 562%          |

*Illustrative modeled economics - not realized customer outcomes, forecasts or guarantees. Release 1.0.0 | 18 July 2026 | MONTREAL.AI*

# Document Control

|                |                                                                                                                               |
|----------------|-------------------------------------------------------------------------------------------------------------------------------|
| Document       | GoalOS Value Realization Dossier Ω                                                                                            |
| Purpose        | Demonstrate, with transparent illustrative economics, where GoalOS can rationally create or protect more value than it costs. |
| Version        | 1.0.0                                                                                                                         |
| Date           | 18 July 2026                                                                                                                  |
| Owner          | MONTREAL.AI / The Singularity Institution                                                                                     |
| Classification | Corporate - illustrative value model                                                                                          |
| Status         | Decision-support documentation; not a customer outcome report                                                                 |

## Model and claim boundary

All figures in this dossier are illustrative management scenarios. They are not realized customer results, audited savings, guaranteed returns, transaction opinions, legal opinions or promises of commercial success. Before use, replace the assumptions with sponsor-approved data and preserve the full Evidence Docket.

## Executive Verdict

GoalOS is most valuable when it is attached to a real decision rather than a vague desire to “use AI.” The qualifying mission has five properties: a named sponsor, approved budget, hard deadline, frozen proof burden and a measurable economic cost of error.

**Across the three modeled base cases, \$325K of external GoalOS fees and \$425K of total investment are associated with \$37.05M of decisions at stake, \$2.82M of modeled gross value and \$2.39M of modeled net value. The portfolio-level modeled ROI is 562%, with 8.7x gross value per external fee dollar.**

| Use case             | Sponsor                   | Deadline         | External fee | Gross value | Net value | ROI  | Value / fee |
|----------------------|---------------------------|------------------|--------------|-------------|-----------|------|-------------|
| AI deployment        | CIO / CISO / BU President | 15 business days | \$75K        | \$801K      | \$701K    | 701% | 10.7x       |
| Capital allocation   | CEO / CFO / Board         | 21 calendar days | \$150K       | \$1.55M     | \$1.35M   | 677% | 10.4x       |
| Commercial proof run | CEO / CRO / Venture       | 60 days          | \$100K       | \$461K      | \$336K    | 269% | 4.6x        |

## The key principle

GoalOS does not need to force a positive recommendation to create value. CONDITION, REPAIR, REJECT and STOP can be economically superior to an unsupported “go” decision.

# 1. The GoalOS Value Thesis

A normal AI system produces output. GoalOS forms the proof-producing institution required to decide whether that output deserves authority, action, payment, memory and reuse. The economic value comes from four distinct channels:

- Expected loss avoided - reducing the probability or severity of a materially wrong decision.
- Time-to-value acceleration - reaching a justified action sooner without bypassing evidence.
- Operating efficiency - reducing duplicate analysis, coordination burden and reviewer effort.
- Reusable capability - preserving only validated tests, workflows and evidence structures for future missions.

## The Value Equation

### Risk-adjusted value

Gross value = expected loss avoided + accelerated benefit + operating savings + validated reusable capability value.  
 Net value = gross value - external fee - internal participation cost. ROI = net value / total investment.

The equation deliberately separates cash value, risk value, time value and reusable capability. None of the components should be hidden inside a single unsupported “ROI” claim.

### MODELED PORTFOLIO VALUE

## Three use cases. One value discipline.

## 2. The Value Qualification Gate

### The GoalOS Value Qualification Gate

GoalOS should be applied where a real decision can earn or protect materially more value than the engagement costs.

1

#### SPONSOR

A named executive can authorize action, evidence access and follow-through.

2

#### BUDGET

Funding is approved and proportionate to conservative risk-adjusted value.

3

#### DEADLINE

A real decision or operating gate exists within 60 days.

4

#### PROOF BURDEN

Material claims, tests, reviewers and acceptance criteria can be frozen.

5

#### COST OF ERROR

The avoidable downside or upside is at least 5x the engagement fee; 10x+ preferred.

Proceed only when the mission can return PROCEED, CONDITION, REPAIR, REJECT or STOP - and each state has economic meaning.

GoalOS should not be sold into every objective. It should be concentrated where evidence can change a decision and where the value at stake materially exceeds the engagement cost.

|                               |                                                                                                         |
|-------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>Named sponsor</b>          | An executive owns the decision, can provide evidence access and can authorize follow-through.           |
| <b>Approved budget</b>        | The mission is funded before work begins; pricing is proportionate to conservative risk-adjusted value. |
| <b>Real deadline</b>          | A board, procurement, deployment, investment or market gate exists within 60 days.                      |
| <b>Frozen proof burden</b>    | Material claims, evidence standards, independent reviewers and acceptance tests can be specified.       |
| <b>Economic cost of error</b> | The avoidable downside or upside is at least 5x the external fee; 10x+ is preferred.                    |
| <b>No-go discipline</b>       | The sponsor accepts that the justified result may be REPAIR, REJECT, PIVOT or STOP.                     |

#### Commercial qualification rule

Do not proceed when there is no accountable sponsor, no evidence access, no real decision date, no cost of error or no willingness to act on an unfavorable result.

### 3. Portfolio Economics

| Use case             | Sponsor                   | Deadline         | External fee | Gross value | Net value | ROI  | Value / fee |
|----------------------|---------------------------|------------------|--------------|-------------|-----------|------|-------------|
| AI deployment        | CIO / CISO / BU President | 15 business days | \$75K        | \$801K      | \$701K    | 701% | 10.7x       |
| Capital allocation   | CEO / CFO / Board         | 21 calendar days | \$150K       | \$1.55M     | \$1.35M   | 677% | 10.4x       |
| Commercial proof run | CEO / CRO / Venture       | 60 days          | \$100K       | \$461K      | \$336K    | 269% | 4.6x        |

The highest modeled value-to-fee ratios appear where GoalOS protects a large capital decision. The commercial proof run has a lower ratio because it is an experiment with smaller absolute economics, but it remains valuable because both success and failure generate actionable evidence.

#### What the numbers actually prove

1. The price can be rational when the decision value and cost of error are large enough.
2. Break-even can be reached through a modest improvement in one explicit driver rather than heroic assumptions across many drivers.
3. The model remains useful if GoalOS returns a negative decision, because avoided loss and avoided burn are legitimate economic outcomes.
4. Actual commercial proof still requires real missions, sponsor-approved assumptions, customer outcomes and independent review where appropriate.

# Use Case 1: Enterprise AI Deployment Decision Assurance

|                               |                                                                                                                            |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>Sponsor</b>                | CIO / CISO / Business President                                                                                            |
| <b>Decision</b>               | Approve, condition, pilot, repair, reject or stop a \$6.0M enterprise AI rollout.                                          |
| <b>Budget</b>                 | \$100,000 total investment                                                                                                 |
| <b>Deadline</b>               | 15 business days                                                                                                           |
| <b>Proof burden</b>           | Vendor claims, architecture, data flows, security, privacy, total cost, acceptance tests, rollout and rollback conditions. |
| <b>Economic cost of error</b> | \$3.20M modeled cost of material error                                                                                     |

## Why this use case creates value

A single bad deployment can destroy far more value than the diligence mission costs. The modeled case reaches break-even if GoalOS reduces the probability of a material error by only 3.1 percentage points, before counting acceleration, labor savings or reuse.

| EXTERNAL FEE                     | GROSS VALUE      | NET VALUE        | MODELED ROI | VALUE / FEE                        |
|----------------------------------|------------------|------------------|-------------|------------------------------------|
| <b>\$75,000<br/>external fee</b> | <b>\$800,723</b> | <b>\$700,723</b> | <b>701%</b> | <b>10.7x gross<br/>value / fee</b> |

**Decision states: PROCEED / CONDITIONAL PROCEED / PILOT ONLY / REPAIR / REJECT / STOP**

*Illustrative base case - replace all assumptions with sponsor-approved data before commercial use.*

## 1.1 Economic Value Bridge

| Value component                   | Modeled value                     | Interpretation                                               |
|-----------------------------------|-----------------------------------|--------------------------------------------------------------|
| Expected loss avoided             | <b>\$384,000</b>                  | Risk-adjusted value of preventing a material decision error. |
| Time-to-value acceleration        | <b>\$276,923</b>                  | Value captured earlier once a safe path is justified.        |
| Internal review savings           | <b>\$79,800</b>                   | Reduced duplicate analysis and coordination burden.          |
| Reusable diligence capability     | <b>\$60,000</b>                   | Future-use value of validated tests and evidence structures. |
| <b>Gross modeled value</b>        | <b>\$800,723</b>                  |                                                              |
| <b>Total investment</b>           | <b>\$100,000 total investment</b> |                                                              |
| <b>Net modeled value</b>          | <b>\$700,723</b>                  |                                                              |
| <b>ROI on total investment</b>    | <b>701%</b>                       |                                                              |
| <b>Gross value / external fee</b> | <b>10.7x gross value / fee</b>    |                                                              |

### Break-even evidence

3.1 percentage-point reduction in error probability is sufficient to cover the modeled total investment before counting every other potential value channel.

## 1.2 Proof Package and Operating Design

GoalOS earns its fee by producing a decision package that a sponsor can inspect, challenge and act upon. The work is not “a report”; it is a bounded institutional process with explicit evidence and authority.

1. Mission Contract
2. AI Claim Matrix
3. Production acceptance tests
4. Financial decision model
5. Risk and control plan
6. Conditional rollout
7. Rollback plan
8. Chronicle disposition

| Best-Practice Mission Structure                                                                                                                                                  |                                                                                       |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| Objective                                                                                                                                                                        | One consequential decision, written in action-ready language.                         |
| Mission Contract                                                                                                                                                                 | Sponsor, scope, budget, deadline, proof level, authority boundary and done condition. |
| Proof Debt                                                                                                                                                                       | All unsupported, contradictory, stale or untested material claims.                    |
| Work formation                                                                                                                                                                   | Agents, people, tools, permissions, budgets and acceptance tests.                     |
| Validation                                                                                                                                                                       | Independent reviewer separation for material claims and risks.                        |
| Evidence Docket                                                                                                                                                                  | Sources, artifacts, tests, contradictions, uncertainty and replay material.           |
| Decision state                                                                                                                                                                   | PROCEED / CONDITIONAL PROCEED / PILOT ONLY / REPAIR / REJECT / STOP                   |
| Chronicle gate                                                                                                                                                                   | Only validated, scoped and versioned capability may influence a later mission.        |
| <b>Value protection</b><br>If material proof fails, GoalOS should narrow, repair, reject, quarantine or stop. Failed work does not earn authority, settlement or trusted memory. |                                                                                       |

# Use Case 2: Board-Level Capital Allocation and Acquisition Diligence

|                               |                                                                                                           |
|-------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Sponsor</b>                | CEO / CFO / Board Sponsor                                                                                 |
| <b>Decision</b>               | Approve, reprice, condition, stage, renegotiate or stop a \$30.0M acquisition and integration commitment. |
| <b>Budget</b>                 | \$200,000 total investment                                                                                |
| <b>Deadline</b>               | 21 calendar days                                                                                          |
| <b>Proof burden</b>           | Commercial, technical, financial, customer, legal, security, integration, synergy and downside evidence.  |
| <b>Economic cost of error</b> | \$8.00M modeled value impairment                                                                          |

## Why this use case creates value

For a board-level allocation, the price of certainty is not the engagement fee. It is the difference between a well-evidenced decision and a materially impaired investment. The modeled case needs only a 2.5 percentage-point risk reduction to cover the full investment.

| EXTERNAL FEE                      | GROSS VALUE        | NET VALUE          | MODELED ROI | VALUE / FEE                        |
|-----------------------------------|--------------------|--------------------|-------------|------------------------------------|
| <b>\$150,000<br/>external fee</b> | <b>\$1,553,339</b> | <b>\$1,353,339</b> | <b>677%</b> | <b>10.4x gross<br/>value / fee</b> |

**Decision states: APPROVE / REPRICE / CONDITION / STAGE / RENEGOTIATE / DECLINE**

*Illustrative base case - replace all assumptions with sponsor-approved data before commercial use.*

## 2.1 Economic Value Bridge

| Value component                   | Modeled value    | Interpretation                                               |
|-----------------------------------|------------------|--------------------------------------------------------------|
| Expected impairment avoided       | <b>\$640,000</b> | Risk-adjusted protection against value impairment.           |
| Negotiation / terms improvement   | <b>\$525,000</b> | Expected value from repricing or contractual protection.     |
| Executive and adviser efficiency  | <b>\$178,750</b> | Reduced duplication and inconclusive diligence.              |
| Synergy / option acceleration     | <b>\$109,589</b> | Value captured earlier from a faster justified decision.     |
| Reusable diligence capability     | <b>\$100,000</b> | Future-use value of validated tests and evidence structures. |
| <b>Gross modeled value</b>        |                  | <b>\$1,553,339</b>                                           |
| <b>Total investment</b>           |                  | <b>\$200,000 total investment</b>                            |
| <b>Net modeled value</b>          |                  | <b>\$1,353,339</b>                                           |
| <b>ROI on total investment</b>    |                  | <b>677%</b>                                                  |
| <b>Gross value / external fee</b> |                  | <b>10.4x gross value / fee</b>                               |

### Break-even evidence

2.5 percentage-point reduction in impairment probability is sufficient to cover the modeled total investment before counting every other potential value channel.

## 2.2 Proof Package and Operating Design

GoalOS earns its fee by producing a decision package that a sponsor can inspect, challenge and act upon. The work is not “a report”; it is a bounded institutional process with explicit evidence and authority.

1. Board decision memo
2. Claim matrix
3. Valuation sensitivity
4. Terms and protection map
5. Integration gate plan
6. Risk register
7. Evidence Docket
8. Chronicle disposition

### Best-Practice Mission Structure

|                         |                                                                                       |
|-------------------------|---------------------------------------------------------------------------------------|
| <b>Objective</b>        | One consequential decision, written in action-ready language.                         |
| <b>Mission Contract</b> | Sponsor, scope, budget, deadline, proof level, authority boundary and done condition. |
| <b>Proof Debt</b>       | All unsupported, contradictory, stale or untested material claims.                    |
| <b>Work formation</b>   | Agents, people, tools, permissions, budgets and acceptance tests.                     |
| <b>Validation</b>       | Independent reviewer separation for material claims and risks.                        |
| <b>Evidence Docket</b>  | Sources, artifacts, tests, contradictions, uncertainty and replay material.           |
| <b>Decision state</b>   | APPROVE / REPRICE / CONDITION / STAGE / RENEGOTIATE / DECLINE                         |
| <b>Chronicle gate</b>   | Only validated, scoped and versioned capability may influence a later mission.        |

### Value protection

If material proof fails, GoalOS should narrow, repair, reject, quarantine or stop. Failed work does not earn authority, settlement or trusted memory.

# Use Case 3: Three-Customer Commercial Proof Run

|                        |                                                                                                                                 |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| Sponsor                | CEO / CRO / Venture Lead                                                                                                        |
| Decision               | Get three real customers to pay for the same \$60K bounded mission and determine whether one asks GoalOS to do it again.        |
| Budget                 | \$125,000 total investment                                                                                                      |
| Deadline               | 60 days                                                                                                                         |
| Proof burden           | Same offer, same acceptance logic, real payment, delivered customer outcomes, contribution margin and repeat-purchase evidence. |
| Economic cost of error | \$1.05M modeled cost of six months on the wrong GTM thesis                                                                      |

### Why this use case creates value

The commercial proof run creates value in either direction. A passing run produces paid evidence and a repeatable offer. A failing run can preserve capital by stopping an unproven thesis before another four months of modeled GTM burn.

| EXTERNAL FEE              | GROSS VALUE                                   | NET VALUE                                   | MODELED ROI | VALUE / FEE            |
|---------------------------|-----------------------------------------------|---------------------------------------------|-------------|------------------------|
| \$100,000<br>external fee | \$461,256<br>probability-weighted gross value | \$336,256<br>probability-weighted net value | 269%        | 4.6x gross value / fee |

Decision states: SCALE / NARROW / REPAIR / PIVOT / STOP

Illustrative base case - replace all assumptions with sponsor-approved data before commercial use.

### 3.1 Economic Value Bridge

| Value component                   | Modeled value | Interpretation                                              |
|-----------------------------------|---------------|-------------------------------------------------------------|
| Pass-path contribution and reuse  | \$265,920     | Contribution and capability value if the offer earns proof. |
| Fail-fast avoided burn            | \$700,000     | Capital preserved if the thesis is falsified early.         |
| Probability-weighted gross value  | \$461,256     | Expected value of learning correctly in either direction.   |
| <b>Gross modeled value</b>        |               | <b>\$461,256 probability-weighted gross value</b>           |
| <b>Total investment</b>           |               | <b>\$125,000 total investment</b>                           |
| <b>Net modeled value</b>          |               | <b>\$336,256 probability-weighted net value</b>             |
| <b>ROI on total investment</b>    |               | <b>269%</b>                                                 |
| <b>Gross value / external fee</b> |               | <b>4.6x gross value / fee</b>                               |

#### Break-even evidence

3.1 mission-equivalents or 0.7 months of avoided burn is sufficient to cover the modeled total investment before counting every other potential value channel.

## 3.2 Proof Package and Operating Design

GoalOS earns its fee by producing a decision package that a sponsor can inspect, challenge and act upon. The work is not “a report”; it is a bounded institutional process with explicit evidence and authority.

1. Frozen offer card
2. Account qualification ledger
3. Three-customer run charter
4. Customer Evidence Dockets
5. Contribution model
6. Repeat-purchase evidence
7. Failure report
8. Chronicle disposition

| Best-Practice Mission Structure                                                                                                                                                  |                                                                                       |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| Objective                                                                                                                                                                        | One consequential decision, written in action-ready language.                         |
| Mission Contract                                                                                                                                                                 | Sponsor, scope, budget, deadline, proof level, authority boundary and done condition. |
| Proof Debt                                                                                                                                                                       | All unsupported, contradictory, stale or untested material claims.                    |
| Work formation                                                                                                                                                                   | Agents, people, tools, permissions, budgets and acceptance tests.                     |
| Validation                                                                                                                                                                       | Independent reviewer separation for material claims and risks.                        |
| Evidence Docket                                                                                                                                                                  | Sources, artifacts, tests, contradictions, uncertainty and replay material.           |
| Decision state                                                                                                                                                                   | SCALE / NARROW / REPAIR / PIVOT / STOP                                                |
| Chronicle gate                                                                                                                                                                   | Only validated, scoped and versioned capability may influence a later mission.        |
| <b>Value protection</b><br>If material proof fails, GoalOS should narrow, repair, reject, quarantine or stop. Failed work does not earn authority, settlement or trusted memory. |                                                                                       |

## 7. Cross-Case Sensitivity

The companion workbook contains downside, base and upside cases. The downside cases are intentionally conservative; they demonstrate that GoalOS can still be economically rational without assuming maximum risk reduction or perfect execution.

| Use case             | Downside ROI | Base ROI | Upside ROI | Base value / fee | Base break-even       |
|----------------------|--------------|----------|------------|------------------|-----------------------|
| AI deployment        | 158%         | 701%     | 1,172%     | 10.7x            | 3.1 pp risk reduction |
| Capital allocation   | 146%         | 677%     | 1,238%     | 10.4x            | 2.5 pp risk reduction |
| Commercial proof run | 126%         | 269%     | 331%       | 4.6x             | 0.7 months of burn    |

### Interpretation

The model should be approved only when the downside case remains tolerable, the base case is grounded in explicit evidence and the engagement can be stopped if the assumptions are not supported.

## 8. Pricing-to-Value Discipline

|                               |                                                                                              |
|-------------------------------|----------------------------------------------------------------------------------------------|
| <b>Decision leverage</b>      | Value at stake / external fee should generally be at least 10x.                              |
| <b>Conservative value</b>     | Modeled gross value should generally be at least 3x total investment; 5x+ is preferred.      |
| <b>Independent break-even</b> | At least one explicit driver should cover the full investment on its own.                    |
| <b>Cash and noncash</b>       | Revenue, savings, risk reduction, acceleration and reusable capability must remain separate. |
| <b>No hidden guarantee</b>    | Modeled values are hypotheses; the Evidence Docket must report actual outcomes.              |
| <b>Repeatability</b>          | Reusable capability is counted only after Chronicle admission and a later-mission test.      |

### Recommended commercial packaging:

- AI Deployment Decision Sprint: \$35K-\$100K depending on risk, evidence access and assurance level.
- Board-Level Proof Mission: \$100K-\$250K+ depending on transaction value, reviewer burden and timeline.
- Three-Customer Commercial Proof Run: \$75K-\$175K depending on acquisition, delivery and evidence scope.
- Recurring Enterprise Proof Office: priced against the value and frequency of protected decisions, not against software seats.

## 9. Measurement, Governance and Value Realization

A strong business case is necessary but not sufficient. GoalOS should be measured against live sponsor outcomes, not the elegance of the architecture.

| Minimum Outcome Ledger |                                                                                      |
|------------------------|--------------------------------------------------------------------------------------|
| Decision quality       | Was the final state supported, challengeable and acted upon?                         |
| Time                   | How much faster was a justified decision reached?                                    |
| Cost                   | What internal and external work was avoided or reduced?                              |
| Risk                   | Which material failure modes were reduced, conditioned or stopped?                   |
| Economic result        | What revenue, margin, savings, avoided loss or option value was actually realized?   |
| Proof quality          | Did evidence reproduce? What remained uncertain? What failed?                        |
| Capability reuse       | Did a Chronicle-admitted capability improve a fresh mission under equal constraints? |
| Customer behavior      | Did the sponsor commission another mission, renewal or expansion?                    |

## 10. Go-Live Decision

### Proceed when

A sponsor can approve the Mission Contract, provide evidence access, commit the budget, accept negative decision states and name the owner of the resulting action.

### Do not proceed when

The engagement is being purchased for theatre, there is no real decision, the sponsor will not provide evidence, the fee is disproportionate to the cost of error, or the customer expects guaranteed revenue or a predetermined recommendation.

**The correct next proof is not another grand claim. It is one real sponsor, one paid mission, one Evidence Docket, one governed decision and one measured outcome.**

**Proof is the gate. Capability is the compound.**
