FIRST SESSION | PRODUCT 20.0.1

Conceptual artwork. Local A0 research. No production authority.

1 · Find the right folder

Goal: complete one explicit synthetic lesson, understand its outcome and restore its exact record. No independent proof, production authority or realized Alpha is created.

Extract 06_PRODUCT/SUCCESSOR_OMEGA_20_0_1_CUSTOMER_PRODUCT.zip. The product folder is SUCCESSOR_OMEGA, containing VERSION.json, VERIFY_PACKAGE.py and 07_NATIVE/. The guide folder is USER_GUIDE_4_0, containing START_LESSON.py. Do not confuse either with a seller archive.

Keep the original ZIP and use a separate new directory for each lesson. Never save runs inside the product.

From a terminal in the product:

```
python3 VERIFY_PACKAGE.py  
node 07_NATIVE/start.mjs doctor
```

The tested host was Linux, Node.js 22.16.0 and Python 3.13.5. That older patch is a test fact, not an installation recommendation. Current security patches and compatibility need their own checks. Windows, macOS and current-LTS qualification are not established by this guide.

When a command is not found: resolve the runtime installation and terminal path with your administrator. Do not bypass a device policy or run everything as administrator.

2 · Choose the guided lesson

From a terminal in the **guide** folder:

```
| python3 START_LESSON.py
```

Choose en, give the extracted product path, select a **NEW** practice folder and choose classify, world or compose.

Route	Use it to learn
classify	Six-signal cases, explicit comparators and case ledgers
world	Temporal episodes, executable hypotheses and bounded prediction
compose	A predictor, shared-resource planner and applicability record

The companion verifies the product and prepares public synthetic evidence. It fills a teaching dossier with approval initially **HOLD**. Read the proposed mission, the alternatives and the gap between this lesson and real work.

No training occurs until you authorize the local research and separately confirm the actual native preflight. The companion is a guide utility; the underlying product remains unchanged.

For the fully native route instead, from the product:

```
| node 07_NATIVE/start.mjs mission wizard
```

Choose 1 for classification, 2 for a classifier successor, 7 for worlds or 9 for composition. These menu numbers are not authority levels.

3 · Inspect, then confirm

Read the dossier before agreeing to local synthetic research. Name the responsible operator. Enter and repeat a private passphrase through the hidden prompt. It protects the signing key only; evidence and models remain readable.

The product's actual preflight then displays the constituted plan. Inspect:

Mission and mapping. What question is being represented? What prose is not automatically compiled?

Evidence and comparison. What is synthetic, reused, exposed or missing? Which comparator modes are actually selected?

Budgets and limits. What search, evaluation, scope and resource limits apply?

Confirm only after reading those fields. A **HOLD** or an unexpected refusal is a reason to inspect, not an instruction to weaken validation.

The companion passes secrets through a process pipe; it does not place them in command arguments. Do not type a passphrase into a shell command, a screenshot, a shared file or a support message.

Cancel: answer no before confirmation, or use Ctrl+C during a run. Preserve any resulting checkpoint or failure record. A cancelled or partial run is not a completed candidate.

4 · Read what actually happened

The lesson creates RUN/ only when native formation reaches the relevant stage. Open its report .html, result.json and mission-dossier.html. Use the JSON/text records when browser policy blocks local navigation.

Result	Interpretation
COMPLETE	The command finished; not proof that the mission won
PASS	The declared local comparison passed
CHILD_BETTER_PREDICTION	Prediction improved; operating benefit is not implied
INSUFFICIENT_ELIGIBLE_EVIDENCE	The requested comparison lacks eligible evidence
INFORMATIONAL_PROPOSAL	A hypothetical proposal, not an approved instruction

The signed files are mission.successor.json, world.successor.json or composition.successor.json. Preserve the native outputs and SESSION.json.

A completed composition lesson does not automatically pin it or produce a live operational decision. Public verification and the separate operator pin are distinct. The full handbook explains how to inspect a current synthetic context before requesting an A0 proposal.

A useful result can be a refusal. Keep a stronger predecessor and the evidence explaining why. A new generation number cannot make old evaluation data fresh.

5 · Restore and choose the next step

The companion asks whether to export and restore. Agree only for the intended lesson. It calls the native commands, restores into a new folder, verifies the result and compares the signed artifact bytes.

Keep every file in EXPORT/. Do not remove a metadata file, repeat checksum lines or rewrite a restricted source into a permissive export. A known restriction can survive model import and succession.

A restored composition does not inherit its operator pin, local preference or current applicability. Inspect the new environment and make any local decision explicitly. No restoration grants production permission.

Next session: inspect the retained result, use a new practice folder, or constitute a real mission through SEIZE. For real evidence, review rights, event identity, outcome availability, comparators and the adapter mapping before training.

Use the complete guide's command catalogue rather than retyping long PDF lines. 03_COMMANDS/COMMANDS_EN.txt keeps each command on one line; uppercase placeholders must be replaced.

Support preparation: record the release, OS/runtime, command, error code and a redacted reproduction. Never send secrets or raw confidential evidence without a separately authorized secure channel.

The next useful decision is not "How do I make the badge greener?" It is "**What evidence or component change could make this mission genuinely better?**"
