

PROOF_LOOPS.md

Field Notes on Machines That Turn Work Into Capability

Vincent Boucher
President, QUEBEC.AI & MONTREAL.AI

AI creates output. GoalOS creates proof.

No proof, no memory. No replay, no settlement. No rollback, no release.

Objective -> Proof Mission -> AGI Jobs -> Evidence -> Chronicle -> Validated Skill -> On-chain Graph Root -> Future Mission Improvement

Objective

Define the decision. Set scope.

Proof Mission

Turn intent into proof work.

AGI Jobs

Create custom jobs. No canned queue.

Evidence

Return bundles, replay, and reviews.

Chronicle

Admit only validated evidence.

Validated Skill

Reusable capability with limits.

On-chain Root

Commit roots, not plaintext.

Future Mission

Use admitted skills as governed priors.

The Proof Loop Kernel

Nothing becomes reusable capability until Chronicle admits it.

repair

priors

User-Friendly Operating Surface

Set an objective. Choose proof level. Create only the AGI Jobs needed by this mission. Inspect evidence. Admit skills only when the gate passes.

Public / Private Proof Boundary

Commitments, graph roots, attestations, and policy proofs can be public. Private method, traces, reviewer notes, and sensitive context stay encrypted or off-chain.

Artifacts That Make Trust Inspectable

Mission Contract, Proof Debt Register, AGI Jobs, ProofBundles, Evidence Docket, Chronicle Decision, Skill Capsule, and Graph Root Record.

Proof Level Ladder

L1

Structural
show loop

L2

Internal
operator review

L3

External
reviewer validation

L4

Handoff
mainnet-ready packet

L5

Chronicle
durable memory

Do not remember what was merely said. Remember what was proven, bounded, replayable, and safe to reuse.

Proof today. Capability forever.
