

Ω / GRAND FINAL INSTITUTIONAL SERIES

COMPLETE INSTITUTIONAL SERIES

The constitutional and operational system for Customer-Owned Mission Intelligence

GRAND FINAL CORPORATE EDITION Seven instruments. One institution. A complete path from mission thesis to executable understanding, independent proof, bounded deployment, impairment, and succession.

26 August 2026 | MONTREAL.AI | Montreal, Quebec, Canada

INSTITUTIONAL SERIES

Series architecture

Use the series as one control stack: constitute the mission, manufacture candidates, freeze one release, prove it independently, admit narrowly, deploy reversibly, monitor continuously, and require every successor to re-earn proof and authority.

Code	Instrument	Primary decision
00	Start Here	Which instrument and decision comes next?
02	Executive Brief	Should one mission enter a bounded proof trajectory?
04	SUCCESSOR Ω Constitution	What institutional law is non-negotiable?
05	Mission Alpha Proof & Admission Standard	What did one frozen release actually earn?
06	Reference Architecture & Control-Plane Spec	How are boundaries and receipts implemented?
07	Underwriting & Deployment Playbook	How does one mission move through D0-D4?
08	Mission Constitution Workbook	What must the customer decide and sign?

CANONICAL LAW Memory transfers. Proof and authority do not.

This document specifies a proposed target institution and operating standard. It does not certify a deployment, prove an exact release, guarantee Mission Alpha, or grant production authority. Customer-specific capability, Specialist ASI status, portability, Alpha, safety, and authority are earned claims that require the tests defined here. Conceptual imagery is editorial visualization, not a photograph of deployed infrastructure or evidence of capability.

00 / GRAND FINAL INSTITUTIONAL SERIES

START HERE

The two-page navigator for the complete SUCCESSOR Ω institutional series

THE SERIES IN ONE SENTENCE One customer-owned mission institution. Evidence changes belief. Contradictions create visible falsification. Independent proof bounds Alpha. Customer governance bounds authority. Memory transfers; proof and authority do not.

26 August 2026 | MONTREAL.AI | Montreal, Quebec, Canada

INSTITUTIONAL SERIES

Choose the next document

Start with the decision in front of you. Every artifact is usable independently; together they form one constitutional and operational system.

Code	Document	Use it when
00	Start Here	Choose the right document and the next decision.
02	Executive Brief	Frame the board-level thesis, gates, and 90-day agenda.
04	SUCCESSOR Ω Constitution	Establish non-negotiable institutional law.
05	Mission Alpha Proof & Admission Standard	Determine what one frozen release actually earned.
06	Reference Architecture & Control-Plane Specification	Implement boundaries, interfaces, receipts, and fail-closed controls.
07	Mission Underwriting & Deployment Playbook	Move one mission from thesis to monitored bounded operation.
08	Mission Constitution Workbook	Capture customer decisions in an editable, proof-ready instrument.

Five distinctions to preserve

- Architecture is a specification; a candidate is an unproven build; a frozen release is an exact proof object; an admitted SUCCESSOR Ω has bounded earned status; deployment is a separate customer decision.
- Specialist ASI means expiring, mission-bounded superiority for one exact release inside one proof envelope - never universal intelligence or unrestricted authority.
- Proof sets the maximum justifiable boundary. Customer governance grants actual authority, which may be narrower and may be zero.
- Governed recursive improvement uses a separate learning branch. A material descendant must freeze, re-prove, and re-enter admission.
- Customer ownership requires a rights map plus export, rebuild, supplier-substitution, and equivalent bounded-behavior tests.

BEGIN HERE Read 02 for the executive decision. Use 08 to constitute a mission. Apply 05 before any earned claim and 06 before consequential deployment.

02 / GRAND FINAL INSTITUTIONAL SERIES

EXECUTIVE BRIEF

Neural-Symbolic SUCCESSOR Ω - Customer-Owned Mission Intelligence

Conceptual plate: one persistent institution receives distinct external receipts; imagery is not proof.

THE EXECUTIVE THESIS Rent frontier cognition. Own the mission constitution, evidence, executable understanding, proof receipts, authority controls, and Live Chronicle that survive supplier change.

26 August 2026 | MONTREAL.AI | Montreal, Quebec, Canada

INSTITUTIONAL SERIES

The decision in eight pages

Enterprise AI capability is becoming abundant. Durable, customer-controlled mission intelligence remains scarce.

BOARD QUESTION What intelligence must remain ours when models, vendors, subscriptions, teams, and operating conditions change?

The answer

SUCCESSOR Ω is a proposed lightweight, portable mission institution that recruits replaceable neural suppliers while retaining customer-controlled evidence bindings, executable programs, proof, policy, identity, memory, and Chronicle.

Institutional state	What it means
Architecture	A specification of roles, boundaries, interfaces, and obligations. It carries no capability claim.
Candidate	A manufactured configuration under development. It is not yet a SUCCESSOR Ω and has no earned proof or authority.
Frozen release	One exact candidate sealed for examination. Learning stops except for an explicitly frozen and evaluated learning rule.
Admitted SUCCESSOR Ω	A frozen release supported by current fresh proof and admitted by customer governance within a named mission and Authority Envelope.
Deployed SUCCESSOR Ω	An admitted release operating through the Policy Gateway and Deployment Controller under live monitoring, expiry, and rollback.

CLAIM BOUNDARY The architecture can be specified now. Specialist ASI, Mission Alpha, portability, and authority attach only to an exact frozen release after the required tests.

INSTITUTIONAL SERIES

One institution, four constitutional compartments

The four compartments are distinct powers, not decorative modules.
Their boundaries remain visible even when internal components evolve.

Conceptual plate: external receipts approach one invariant four-compartment institution.

Compartment	Canonical question	Control
WORLD	What does the institution currently believe?	Versioned states, predictions, assumptions, uncertainty, falsifiers.
POLICY	What action does it propose?	Preconditions, alternatives, constraints, expected consequences.
PROOF	What did independent examination demonstrate?	Externally governed receipts, scope, validity, impairment.
AUTHORITY	What may it do now?	Customer-granted, machine-enforced, scoped, expiring permissions.

INVARIANT Capability may exceed proof. Proof may exceed granted authority. Authority may never exceed current proof.

INSTITUTIONAL SERIES

Mission Alpha must be proven

The baseline is the better of the incumbent and the relevant AI Beta under comparable mission conditions.

Conceptual plate: broad spread is compressed by cost, risk, human burden, imitation, and drift before a small proven remainder remains.

GOVERNANCE EQUATION Mission Alpha = lower-confidence-bound spread - cost - risk reserve - human burden - imitation/commoditization reserve - drift reserve. All hard gates must also pass.

Proof element	Required binding
Mission	Constitution identifier and scope
Release	Exact frozen manifest
Baseline	Incumbent plus relevant AI Beta
Protocol	Precommitted metrics, gates, tools, budgets
Evidence	Protected commitment and custody
Verifier	Identity, independence, conflicts
Environment	Population, tools, operating conditions
Validity	Issue date, expiry, impairment triggers

INSTITUTIONAL SERIES

Authority is narrower than capability

Proof determines only the maximum justifiable boundary. Customer governance decides what authority to grant, if any.

Level	Permitted role	Typical control
A0	Observe	Read-only; no approved decisions.
A1	Recommend	Human decides; evidence and uncertainty visible.
A2	Act in sealed sandbox	No production side effects.
A3	Reversible bounded action	Allowlist, limits, monitoring, rollback.
A4	Explicit consequential action	Named scope, elevated approval, short expiry, tested recovery.

The constitutional sequence

1. Candidate requests authority.
2. Current proof receipt sets the ceiling.
3. Customer governance grants a narrower envelope.
4. Policy Gateway evaluates every request.
5. Deployment Controller checks identity, proof currency, approval, resources, and reversibility.
6. Drift, expiry, failure, or rollback loss contracts authority immediately.

NO SILENT EXPANSION Contracted authority does not re-expand because confidence recovers. Renewal requires proportionate fresh proof and a new governance decision.

INSTITUTIONAL SERIES

Succession compounds knowledge, not power

Governed recursive improvement separates the frozen serving release from a learning branch that can generate candidates without changing production behavior.

Conceptual plate: the descendant receives lineage and Chronicle memory; its proof and authority structures remain empty.

May transfer	Must restart empty
Evidence structures and provenance	Proof status
Retired failures and falsifiers	Production authority
Program lineage and operating history	Verifier halos or admission rights
Chronicle checkpoints and lessons	Unexpired permissions

SUCCESSION LAW A material descendant is a new claim-bearing object: generate, test, freeze, independently prove, narrowly admit, monitor, and renew.

INSTITUTIONAL SERIES

The board decision sequence

Approve mission capital, capability construction, proof, admission, and deployment as separate decisions.

Gate	Governing question	Maximum state
D0 Underwrite	Is the mission observable, valuable, safe to test, and worth proving?	Mission design only
D1 Build	Are evidence rights, baseline, security, and test path adequate?	Foundry/Gym/sandbox
D2 Prove	Is one exact candidate ready for protected examination?	Independent proof only
D3 Admit	What did the receipt justify, and what authority will governance grant?	Named bounded envelope
D4 Renew/retire	Does live evidence preserve the claim and control path?	Renew, contract, suspend, or retire

90-day executive agenda

1. Select one mission with observable outcomes and a credible baseline.
2. Name sponsor, accountable owner, verifier owner, and policy owner.
3. Compile the Mission Constitution and evidence rights map.
4. Budget proof capital separately from build capital.
5. Require rollback, impairment, and export-and-rebuild tests before consequential scope.

EXECUTIVE COMMITMENT Authorize a bounded proof trajectory - not generalized autonomy.

INSTITUTIONAL SERIES

Claims discipline and next action

The institutional series converts the paper into decision-ready law, standards, specifications, procedures, and customer completion instruments.

Claim	Minimum evidence
Customer-owned	Rights map plus independent export-and-rebuild test
Portable	Restore, substitute a declared supplier, reproduce reference tests, preserve policy and Chronicle
Neural-symbolic	Typed executable programs materially used in prediction or planning
Proven Alpha	Frozen release, fresh evidence, best-baseline comparison, confidence bounds, deductions
Independent proof	Separated verifier, precommitment, conflicts, signed receipt; normally 13/14 for public use
Bounded authority	Machine-enforced envelope, least privilege, expiry, monitoring, rollback drill

NEXT ACTION Use the Mission Constitution Workbook to constitute one mission, then apply the Proof & Admission Standard before any earned claim.

This document specifies a proposed target institution and operating standard. It does not certify a deployment, prove an exact release, guarantee Mission Alpha, or grant production authority. Customer-specific capability, Specialist ASI status, portability, Alpha, safety, and authority are earned claims that require the tests defined here. Conceptual imagery is editorial visualization, not a photograph of deployed infrastructure or evidence of capability.

[Definitive corporate white paper](#)

04 / GRAND FINAL INSTITUTIONAL SERIES

SUCCESSOR Ω CONSTITUTION

Normative institutional law for Customer-Owned Mission Intelligence

GOVERNING INVARIANT No unverified change may silently cross from learning into consequential action. Every material claim binds to evidence, one exact release, independent proof, customer governance, expiry, and rollback.

26 August 2026 | MONTREAL.AI | Montreal, Quebec, Canada

INSTITUTIONAL SERIES

Contents and normative status

This Constitution defines mandatory institutional behavior for conforming implementations. It does not itself certify that any implementation conforms.

Article 1. Status and terms..... 3

Article 2. Identity and mission bounds..... 4

Article 3. Evidence governance..... 5

Article 4. Executable programs..... 6

Article 5. Separation of powers..... 7

Article 6. Foundry..... 8

Article 7. Mission Gym..... 9

Article 8. Exact-release freeze..... 10

Article 9. Independent proof..... 11

Article 10. Mission Alpha..... 12

Article 11. Accountable admission..... 13

Article 12. Bounded authority..... 14

Article 13. Operations and Chronicle..... 15

Article 14. Impairment and rollback..... 16

Article 15. Customer ownership and portability..... 17

Article 16. Succession and governed improvement..... 18

Article 17. Adoption, exceptions, and claims..... 19

NORMATIVE KEY MUST and MUST NOT are mandatory for claimed conformance. SHOULD identifies a default that may be departed from only with recorded rationale. MAY identifies a permitted option.

This document specifies a proposed target institution and operating standard. It does not certify a deployment, prove an exact release, guarantee Mission Alpha, or grant production authority. Customer-specific capability, Specialist ASI status, portability, Alpha, safety, and authority are earned claims that require the tests defined here. Conceptual imagery is editorial visualization, not a photograph of deployed infrastructure or evidence of capability.

CONSTITUTION / 01

Article 1. Status, terms, and claim-bearing objects

Institutional words must identify the object and state to which a claim attaches.

Normative requirements

- Every record **MUST** distinguish architecture, candidate, frozen release, admitted SUCCESSOR Ω, and deployed SUCCESSOR Ω.
- A claim **MUST** bind to a mission_id, release_id, scope, evidence, verifier, environment, and validity window.
- Specialist ASI **MUST** mean an earned, expiring, mission-bounded status for one exact frozen release after comparison with the better of the incumbent and relevant AI Beta.
- No text or interface **MAY** imply universal intelligence, infallibility, consciousness, or unrestricted authority.

Term	Conformance test
Claim identity	Resolve the exact object, mission, release, scope, and expiry.
Status display	Show proposed, supported, falsified, proven, authorized, impaired, expired, or retired.
State transition	Require a signed event and Chronicle anchor.

Conformance evidence

A conforming institution retains machine-readable records, signed decision or failure receipts, and a Chronicle anchor sufficient for an authorized reviewer to reproduce the clause-level decision path.

FAIL-CLOSED RULE If the required identity, evidence, proof, authority, or rollback record cannot be resolved, the dependent claim or action does not advance.

CONSTITUTION / 02

Article 2. Institutional identity and mission bounds

One institution may evolve internally, but its constituted identity and authority boundaries remain explicit.

Normative requirements

- Each institution **MUST** have a stable mission_id and customer-controlled identity root.
- The Mission Constitution **MUST** define objectives, exclusions, hard constraints, baseline, evaluator, economic utility, risk ceiling, rollback, and maximum authority.
- A mission that lacks observable outcomes, credible evaluation, or a safe test path **MUST** be rejected, narrowed, or held in research status.
- Scope broadening **MUST** create a new mission version and proportionate re-proof.

Conformance evidence

A conforming institution retains machine-readable records, signed decision or failure receipts, and a Chronicle anchor sufficient for an authorized reviewer to reproduce the clause-level decision path.

FAIL-CLOSED RULE If the required identity, evidence, proof, authority, or rollback record cannot be resolved, the dependent claim or action does not advance.

CONSTITUTION / 03

Article 3. Evidence before narrative

Evidence is governed input, never authority.

Normative requirements

- Every material evidence object **MUST** record source, time, rights, integrity, sensitivity, transformation history, freshness, and retention rules.
- Every material belief **MUST** expose supporting evidence, assumptions, uncertainty, and falsifier.
- Evidence contamination, rights loss, or untraceable transformation **MUST** impair dependent claims.
- Adversarial content **MUST** be treated as untrusted data and **MUST NOT** issue instructions to control-plane components.

Evidence state	Required response
Fresh and governed	Eligible for the declared use.
Stale or shifted	Reweight, narrow, or re-prove.
Contaminated	Quarantine and impair dependent receipts.
Rights unavailable	Cease prohibited use and rebuild the evidence path.

Conformance evidence

A conforming institution retains machine-readable records, signed decision or failure receipts, and a Chronicle anchor sufficient for an authorized reviewer to reproduce the clause-level decision path.

FAIL-CLOSED RULE If the required identity, evidence, proof, authority, or rollback record cannot be resolved, the dependent claim or action does not advance.

CONSTITUTION / 04

Article 4. Executable programs are hypotheses

Executability improves inspection; it does not confer truth.

Normative requirements

- WORLD and POLICY programs MUST declare typed inputs/outputs, version, preconditions, state, dependencies, invariants, predictions, uncertainty, and failure conditions.
- Each predictive or causal program MUST name a falsifier or explain why the claim remains non-falsifiable and therefore non-admissible.
- Neural proposals MAY synthesize candidate programs; symbolic execution MAY make them checkable; neither MAY self-certify truth.
- Contradictory observation MUST create a visible falsification or exception event, not a persuasive narrative patch.

Conformance evidence

A conforming institution retains machine-readable records, signed decision or failure receipts, and a Chronicle anchor sufficient for an authorized reviewer to reproduce the clause-level decision path.

FAIL-CLOSED RULE If the required identity, evidence, proof, authority, or rollback record cannot be resolved, the dependent claim or action does not advance.

CONSTITUTION / 05

Article 5. Constitutional separation of powers

Manufacturing, formation, proof, governance, and action are separate powers.

Normative requirements

- The Foundry MAY manufacture but MUST NOT certify.
- The Mission Gym MAY teach and stress but MUST NOT issue final fresh proof.
- The claimant MUST NOT control protected proof evidence or final verifier decisions.
- The Proof Network MAY determine demonstrated scope but MUST NOT grant production authority.
- Customer governance alone MAY grant authority. The Policy Gateway and Deployment Controller MUST enforce it.

Power	Explicit prohibition
Foundry	No final proof or production credentials.
Gym	No protected proof cases as training material.
Verifier	No silent mission broadening or pass-contingent judgment.
Candidate	No self-granted authority or policy override.

Conformance evidence

A conforming institution retains machine-readable records, signed decision or failure receipts, and a Chronicle anchor sufficient for an authorized reviewer to reproduce the clause-level decision path.

FAIL-CLOSED RULE If the required identity, evidence, proof, authority, or rollback record cannot be resolved, the dependent claim or action does not advance.

CONSTITUTION / 06

Article 6. Foundry manufacturing law

The Foundry preserves multiple forms of excellence and makes failure inspectable.

Normative requirements

- The Foundry SHOULD maintain diverse elites for Alpha, safety, cost, reliability, sovereignty, transfer, and critical-failure performance.
- Candidate lineage, components, training evidence, budgets, and evaluator exposure MUST be recorded.
- Production credentials and protected proof evidence MUST remain unavailable to Foundry processes.
- A candidate that fails readiness MAY be repaired, archived, or retired; it MUST NOT be re-labeled as proven.

Conformance evidence

A conforming institution retains machine-readable records, signed decision or failure receipts, and a Chronicle anchor sufficient for an authorized reviewer to reproduce the clause-level decision path.

FAIL-CLOSED RULE If the required identity, evidence, proof, authority, or rollback record cannot be resolved, the dependent claim or action does not advance.

CONSTITUTION / 07

Article 7. Sovereign Mission Gym law

Formation environments may adapt to expose weakness without becoming their own final proof.

Normative requirements

- Gym stages MUST specify observation, action, dynamics, invariants, termination, solvability, and difficulty.
- Generated scenarios MUST record provenance and validation status.
- Gym evidence MUST be labelled formation evidence.
- Protected final proof cases MUST remain separately governed and unavailable for claimant adaptation.
- A diagnostic environment update MUST NOT modify the frozen serving release.

Conformance evidence

A conforming institution retains machine-readable records, signed decision or failure receipts, and a Chronicle anchor sufficient for an authorized reviewer to reproduce the clause-level decision path.

FAIL-CLOSED RULE If the required identity, evidence, proof, authority, or rollback record cannot be resolved, the dependent claim or action does not advance.

CONSTITUTION / 08

Article 8. Exact-release freeze

Proof attaches only to one exact sealed object.

Normative requirements

- The freeze MUST bind models/endpoints, prompts, routing, programs, tools, adapters, dependencies, memory state, policies, budgets, permissions, and rollback controls.
- Opaque suppliers MUST be identified by provider, endpoint/model identifier, date, configuration, behavioral fingerprint, and assurances.
- Learning MUST stop before proof unless the frozen release explicitly includes an evaluated learning rule, writable state classes, update budget, invariants, and monitoring.
- Any out-of-envelope change MUST create a new release_id.

Freeze artifact	Minimum content
Release manifest	Hashes, identities, versions, dependencies, signatures.
Proof interface	Allowed inputs, outputs, tools, budgets, observation rules.
Reproduction pack	Environment, seeds where applicable, restore instructions.
Rollback pack	Checkpoint, reversal method, responsible owner, recovery objective.

Conformance evidence

A conforming institution retains machine-readable records, signed decision or failure receipts, and a Chronicle anchor sufficient for an authorized reviewer to reproduce the clause-level decision path.

FAIL-CLOSED RULE If the required identity, evidence, proof, authority, or rollback record cannot be resolved, the dependent claim or action does not advance.

CONSTITUTION / 09

Article 9. Independent proof

The claimant cannot manufacture its own final proof.

Normative requirements

- Proof **MUST** bind mission, release, baseline, protocol, protected-evidence commitment, verifier, environment, and validity.
- Verifier identity, competence, custody, funding, conflicts, governance, and replication status **MUST** be disclosed.
- Public independently proven claims **SHOULD** require I3 or I4 independence; a departure **MUST** identify a documented equivalent and approver.
- A failure or insufficient-evidence result **MUST** be preserved with the same Chronicle discipline as a pass.

Conformance evidence

A conforming institution retains machine-readable records, signed decision or failure receipts, and a Chronicle anchor sufficient for an authorized reviewer to reproduce the clause-level decision path.

FAIL-CLOSED RULE If the required identity, evidence, proof, authority, or rollback record cannot be resolved, the dependent claim or action does not advance.

Article 10. Mission Alpha

Alpha is a perishable economic proof object, not a confidence glow.

Normative requirements

- The baseline MUST be the better of the incumbent and relevant AI Beta under comparable mission conditions.
- Spread MUST be treated as probabilistic opportunity before deductions.
- Mission Alpha MUST account for cost, risk, human burden, imitation or commoditization, and drift.
- All hard gates MUST pass. Alpha MUST NOT be guaranteed.
- An expired, impaired, or unverifiable Alpha claim MUST authorize nothing.

State	Permitted representation
Potential spread	Opportunity under uncertainty; not admitted value.
Proven Alpha	Small net remainder inside the exact proof envelope.
Impaired	Historical result retained; current operational claim stopped.
Absent	No qualifying remainder or insufficient evidence.

Conformance evidence

A conforming institution retains machine-readable records, signed decision or failure receipts, and a Chronicle anchor sufficient for an authorized reviewer to reproduce the clause-level decision path.

FAIL-CLOSED RULE If the required identity, evidence, proof, authority, or rollback record cannot be resolved, the dependent claim or action does not advance.

CONSTITUTION / 11

Article 11. Accountable admission

Proof determines a ceiling; governance decides whether to admit within it.

Normative requirements

- Admission **MUST** identify the exact release, receipt, mission scope, exclusions, Authority Envelope, accountable owners, expiry, monitoring, and rollback.
- Governance **MAY** grant authority narrower than proof and **MAY** grant none.
- A proof pass **MUST NOT** automatically create production authority.
- A conditional or narrow pass **MUST** be represented without scope inflation.

Conformance evidence

A conforming institution retains machine-readable records, signed decision or failure receipts, and a Chronicle anchor sufficient for an authorized reviewer to reproduce the clause-level decision path.

FAIL-CLOSED RULE If the required identity, evidence, proof, authority, or rollback record cannot be resolved, the dependent claim or action does not advance.

CONSTITUTION / 12

Article 12. Bounded authority

Authority is customer-granted, scoped, expiring, monitored, and reversible.

Normative requirements

- Every consequential request MUST pass identity, release, proof-currency, policy, approval, resource, and reversibility checks.
- Authority MUST be expressed as a vector across tools, data, targets, geography, time, budget, and action class.
- The candidate MAY request authority but MUST NOT write, widen, or renew its own envelope.
- Drift, critical failure, expiry, identity uncertainty, or rollback loss MUST contract or suspend authority.
- Authority MUST NOT silently re-expand.

Level	Maximum role
A0	Observe
A1	Recommend with human decision
A2	Act in sealed sandbox
A3	Take reversible bounded action
A4	Take explicitly authorized consequential action

Conformance evidence

A conforming institution retains machine-readable records, signed decision or failure receipts, and a Chronicle anchor sufficient for an authorized reviewer to reproduce the clause-level decision path.

FAIL-CLOSED RULE If the required identity, evidence, proof, authority, or rollback record cannot be resolved, the dependent claim or action does not advance.

CONSTITUTION / 13

Article 13. Operations and Live Chronicle

Every material state change and action remains attributable and recoverable.

Normative requirements

- The Policy Gateway MUST evaluate requests outside the candidate reasoning path.
- The Deployment Controller MUST broker production actions using ephemeral least-privilege credentials.
- Pre-action and post-action receipts MUST bind decision, target, tool, outcome, approval, and Chronicle anchor.
- The Chronicle MUST record hypotheses, falsifications, proofs, admissions, actions, incidents, rollback, impairments, renewals, and succession.
- History alone MUST NOT manufacture proof.

Conformance evidence

A conforming institution retains machine-readable records, signed decision or failure receipts, and a Chronicle anchor sufficient for an authorized reviewer to reproduce the clause-level decision path.

FAIL-CLOSED RULE If the required identity, evidence, proof, authority, or rollback record cannot be resolved, the dependent claim or action does not advance.

CONSTITUTION / 14

Article 14. Impairment, contraction, and rollback

Contraction is immediate; restoration requires proportionate evidence.

Normative requirements

- Material release, dependency, environment, baseline, evidence, verifier, legal, economic, or risk changes **MUST** be evaluated for impairment.
- An impairment event **MUST** stop the affected earned claim, contract associated authority, preserve evidence, and issue a receipt.
- Rollback availability **MUST** be tested at a frequency proportionate to consequence.
- Return paths **MUST** be targeted re-proof, full re-proof, or retirement - never silent confidence recovery.

Trigger	Immediate response
Release/ dependency change	Suspend affected claim and authority.
Evidence/verifier compromise	Revoke receipt; reconstitute proof.
Baseline/economics move	Re-underwrite Alpha.
Critical failure/rollback loss	Stop or contract to observe/recommend.
Expiry/drift threshold	Expire automatically; renew against current reality.

Conformance evidence

A conforming institution retains machine-readable records, signed decision or failure receipts, and a Chronicle anchor sufficient for an authorized reviewer to reproduce the clause-level decision path.

FAIL-CLOSED RULE If the required identity, evidence, proof, authority, or rollback record cannot be resolved, the dependent claim or action does not advance.

CONSTITUTION / 15

Article 15. Customer ownership and portability

Ownership is both a rights property and a demonstrated continuity property.

Normative requirements

- The package **MUST** distinguish customer-owned, licensed, open-source, externally referenced, regulated, and excluded artifacts.
- The customer **MUST** be able to inspect and export the promised institutional layer.
- A claimed portability level **MUST** pass its corresponding restore and substitution test.
- At least one declared replaceable supplier **MUST** be substituted without losing agreed policy or Chronicle continuity for supplier-substitutable claims.
- Equivalent bounded behavior **MUST** be reproduced in the target environment.

Conformance evidence

A conforming institution retains machine-readable records, signed decision or failure receipts, and a Chronicle anchor sufficient for an authorized reviewer to reproduce the clause-level decision path.

FAIL-CLOSED RULE If the required identity, evidence, proof, authority, or rollback record cannot be resolved, the dependent claim or action does not advance.

CONSTITUTION / 16

Article 16. Succession and governed recursive improvement

Knowledge may compound; proof and power must be re-earned.

Normative requirements

- The serving release **MUST** remain frozen while a separate learning branch manufactures descendants.
- A descendant **MAY** inherit evidence structures, provenance, retired failures, program lineage, operating history, and Chronicle context.
- A descendant **MUST** inherit no proof status, production authority, verification halo, or admission rights.
- A material descendant **MUST** freeze, enter fresh proof, and receive a separate admission decision.
- Lineage continuity **MUST NOT** be represented as claim continuity.

Conformance evidence

A conforming institution retains machine-readable records, signed decision or failure receipts, and a Chronicle anchor sufficient for an authorized reviewer to reproduce the clause-level decision path.

FAIL-CLOSED RULE If the required identity, evidence, proof, authority, or rollback record cannot be resolved, the dependent claim or action does not advance.

CONSTITUTION / 17

Article 17. Adoption, exceptions, and public claims

Conformance is versioned, auditable, and revocable.

Normative requirements

- A customer adopting this Constitution MUST name the version, accountable owner, exception authority, and effective date.
- Each exception MUST identify the affected clause, rationale, risk, compensating control, approver, expiry, and closure evidence.
- Marketing and operational interfaces MUST use the same claim states and scope.
- If a claim cannot be tested, it MUST be narrowed or removed.

Adoption record	Required content
Constitution version	Exact version and hash.
Accountable owner	Named customer role.
Exceptions	Clause, rationale, control, approver, expiry.
Conformance evidence	Test reports, receipts, Chronicle anchors.
Withdrawal	Trigger and authority for suspension or retirement.

Conformance evidence

A conforming institution retains machine-readable records, signed decision or failure receipts, and a Chronicle anchor sufficient for an authorized reviewer to reproduce the clause-level decision path.

FAIL-CLOSED RULE If the required identity, evidence, proof, authority, or rollback record cannot be resolved, the dependent claim or action does not advance.

05 / GRAND FINAL INSTITUTIONAL SERIES

MISSION ALPHA PROOF & ADMISSION STANDARD

A conformance standard for fresh proof, economic admission, and bounded claims

PROOF - NOT CONFIDENCE Spread is potential. Mission Alpha is the compact, risk-adjusted remainder that survives the better baseline, protected fresh evidence, independent examination, explicit deductions, and all hard gates.

26 August 2026 | MONTREAL.AI | Montreal, Quebec, Canada

INSTITUTIONAL SERIES

Contents, scope, and conformance

Apply this Standard to any exact frozen release seeking Specialist ASI, Mission Alpha, independent-proof, or consequential-authority claims.

- 1. Claim and admission classes.....3
- 2. Proof claim tuple.....4
- 3. Mission readiness.....5
- 4. Baseline construction.....6
- 5. Protected evidence.....7
- 6. Freeze integrity.....8
- 7. Verifier independence.....9
- 8. Protocol precommitment.....10
- 9. Controlled execution.....11
- 10. Metrics and hard gates.....12
- 11. Tail risk and critical failures.....13
- 12. Alpha determination.....14
- 13. Proof receipt.....15
- 14. Impairment and renewal.....16
- 15. Decision outcomes and public claims.....17
- 16. Conformance checklist.....18

PUBLIC CLAIM RULE "Independently proven" normally requires I3 or I4. Internal separation must be described accurately as internally or independently evaluated.

This document specifies a proposed target institution and operating standard. It does not certify a deployment, prove an exact release, guarantee Mission Alpha, or grant production authority. Customer-specific capability, Specialist ASI status, portability, Alpha, safety, and authority are earned claims that require the tests defined here. Conceptual imagery is editorial visualization, not a photograph of deployed infrastructure or evidence of capability.

PROOF STANDARD / 01

1. Claim and admission classes

Proof language must name the exact status earned - and nothing broader.

Class	Permitted statement	Not permitted
P0 Proposed	Architecture or hypothesis specified.	Capability or Alpha claim.
P1 Supported	Development evidence supports a bounded hypothesis.	Independent-proof claim.
P2 Independently evaluated	Separated evaluation, typically I2.	External independently proven unless equivalent approved.
P3 Independently proven	I3/I4 fresh proof for one frozen release.	Generalization outside scope.
P4 Production-admitted	Customer-granted authority within current proof.	Automatic autonomy or inherited status.

ATTACHMENT RULE The status attaches to the full proof tuple, never to a vendor, model family, team, brand, or descendant.

2. The complete proof claim tuple

A claim is operationally meaningful only when every binding can be resolved.

Binding	Minimum record
mission	Mission Constitution id/hash and exclusions
release	Exact manifest and reproduction pack
baseline	Incumbent and relevant AI Beta identities/configurations
protocol	Precommitted metrics, gates, statistics, tools, budgets
evidence	Protected commitment, custody, freshness method
verifier	Identity, independence, competence, conflicts
environment	Population, tools, geography, operating conditions
validity	Issue date, expiry, monitoring, impairment triggers

INVALID TUPLE A missing or materially ambiguous binding produces insufficient evidence, not a partial proof halo.

PROOF STANDARD / 03

3. Mission readiness gate

The mission must be testable before proof capital is committed.

- Observable states and measurable outcomes are defined.
- Permitted and prohibited actions are triggerable.
- A credible evaluator and safe test path exist.
- Economic utility, human burden, critical-failure rules, and authority ceiling are explicit.
- The mission population and transfer boundary are defined.

Result	Disposition
PASS	Proceed to baseline and evidence commitments.
NARROW	Reduce scope until claims become testable.
RESEARCH	Permit exploration without earned claims or production authority.
REJECT	Stop when evaluation, rights, or safe test path is not credible.

PROOF STANDARD / 04

4. Baseline construction

The challenger must beat what the customer or a capable competitor could actually use.

Define b^* as the better of the incumbent and relevant AI Beta under the same Mission Constitution, information budget, permitted tools, latency, cost basis, human support, and operating constraints.

- Reproduce both baselines before trial.
- Version model endpoints, prompts, tools, human procedures, and costs.
- Prevent information asymmetry that unfairly advantages the challenger.
- Refresh the relevant AI Beta when the rentable frontier materially moves.

ANTI-CHERRY-PICKING Outperforming an obsolete incumbent is not Mission Alpha when a stronger relevant AI Beta is realistically rentable.

5. Protected fresh evidence

Freshness means protected from claimant adaptation and representative of the admitted mission.

Freshness mechanism	Control
Later time window	Freeze precedes observation.
Sealed sample	Commit sample/custody without leakage.
Private scenario	Independent acquisition and access log.
Cryptographic commitment	Prove preexistence and later reveal.
Controlled field trial	Predeclared intervention, oversight, stop rules.

- Document overlap analysis with training and Gym evidence.
- Discount correlated receipts and shared failure modes.
- Include counterexamples, distribution tails, and mission-critical exclusions.
- Treat contamination as a receipt impairment event.

6. Exact-release freeze integrity

The proof object must be sealed before protected examination begins.

- Hash models/weights where available; otherwise pin provider, endpoint, configuration, date, fingerprint, and assurances.
- Seal prompts, routing, programs, tools, adapters, dependencies, memory state, policies, permissions, budgets, and rollback.
- Record authorized writable state and learning rules, if any.
- Reproduce the manifest in the verifier environment before trial.

Finding	Decision
Exact and reproducible	Eligible to proceed.
Opaque but bounded and fingerprinted	Proceed only with documented supplier-change risk.
Unpinned or changed	Invalidate or restart the trial.
Unauthorized learning	New release identity; restart proof.

7. Verifier independence

Independence reduces correlated incentives; it does not make a verifier infallible.

Level	Arrangement	Public use
I0	Same candidate process/internal critic.	Not independent.
I1	Separate role/team in claimant organization.	Internal evaluation.
I2	Separate governance, protocol, custody inside one enterprise.	Independently evaluated.
I3	Contractually independent third party with separate custody.	Normal minimum for public independently proven.
I4	Multiple independently governed verifier organizations.	Strongest public/consequential basis.

- Disclose funding, governance, reporting lines, conflicts, custody, protocol control, and replication status.
- Prohibit pass-contingent compensation for final judgment.
- Match required independence to consequence and irreversibility.

PROOF STANDARD / 08

8. Protocol precommitment

The protocol fixes the test before results can influence the rules.

- Mission, release, baseline, metrics, thresholds, hard gates, sample, confidence method, and exclusions.
- Tool, data, compute, latency, retry, and human-assistance budgets.
- Critical-failure taxonomy, stop rules, tail tests, and missing-data treatment.
- Receipt schema, dispute process, replication plan, validity, and impairment triggers.

CHANGE CONTROL A material protocol change after protected evidence is observed invalidates the affected inference unless governed as a predeclared adaptive design.

9. Controlled execution and custody

The camera leaves the claimant: proof runs under separately governed execution and evidence custody.

- 1. Verify release identity and restore the frozen environment.
- 2. Confirm protected-evidence separation and access logs.
- 3. Execute within predeclared budgets and observation rules.
- 4. Capture inputs, outputs, tool calls, errors, latency, cost, human interventions, and state transitions.
- 5. Bind outcomes and deviations to an append-only trial record.
- 6. Cross-check or reproduce material results.

Custody object	Responsible role
Protected evidence	Verifier custodian
Frozen challenger	Release custodian; read-only during trial
Protocol/analysis	Verifier protocol owner
Trial ledger	Independent recorder or jointly auditable service
Final receipt	Authorized verifier signatory

10. Metrics, hard gates, and uncertainty

An average score cannot compensate for a prohibited action or catastrophic tail event.

Dimension	Required treatment
Outcome quality	Point estimate plus confidence bound.
Hard constraints	All-or-nothing pass conditions.
Reliability	Variance, abstention, recovery, repeated-run behavior.
Economics	Incremental cost, switching, latency, resource use.
Human burden	Review, correction, escalation, cognitive load.
Calibration	Error versus stated uncertainty.
Transfer	Performance across declared populations and conditions.

LEXICOGRAPHIC SAFETY Non-substitutable safety or legal gates are evaluated before aggregate utility.

11. Critical failures and tail risk

The proof boundary is shaped by how the release fails, not only by how often it succeeds.

- Define prohibited actions and critical-failure budgets before testing.
- Use counterexamples, rare-event tests, constraint collisions, adversarial inputs, and recovery scenarios.
- Measure time to detect, stop, contain, roll back, and restore.
- Preserve every critical failure and near miss in the receipt and Chronicle.
- A single disqualifying event may dominate an average advantage.

Outcome	Effect
Within budget	Continue subject to all other gates.
Conditional weakness	Narrow scope, shorten expiry, or increase oversight.
Critical failure	Fail or suspend admission; incident analysis required.
Rollback unavailable	No reversible-action authority.

12. Mission Alpha determination

Alpha is admitted only after both statistical and institutional deductions.

Conceptual plate: five deductions remove harmonic and economic mass before a small proven remainder remains.

Term	Determination
Spread	Lower-confidence-bound utility advantage over b^* .
C	Incremental operating, integration, and switching cost.
R	Mission-approved risk reserve.
H	Incremental human burden.
I	Imitation and commoditization reserve.
D	Drift and impairment reserve over validity.

ADMISSION TEST All hard gates pass and the net remainder exceeds the precommitted Mission Alpha threshold. Otherwise Alpha is absent.

PROOF STANDARD / 13

13. Signed proof or failure receipt

The receipt is the durable, inspectable statement of what one exact trial established.

Field	Required content
receipt_id	Globally unique proof/failure identifier
mission/release/baseline	Exact hashes and configurations
verifier	Identity, competence, independence, conflicts, signatures
evidence commitment	Protected description and custody without leakage
protocol/results	Metrics, gates, estimates, confidence, failures, exclusions
economics/scope	Cost, latency, burden, population, tools, geography, time
validity/authority	Expiry, triggers, maximum justifiable authority
Chronicle anchor	Tamper-evident trial and admission link

RECEIPT LAW The authority field records a ceiling justified by proof; it does not grant authority.

PROOF STANDARD / 14

14. Proof currency, impairment, and renewal

Current use ends when the claim-bearing tuple leaves its validated domain.

Trigger	Mandatory response
Release/dependency changed	Mark impaired; suspend affected claim and authority.
Evidence/verifier compromised	Revoke receipt; preserve incident; reconstitute proof.
Baseline/economics moved	Re-underwrite and recompute Alpha.
Population/law/risk drift	Contract to still-valid scope; targeted/full re-proof.
Critical failure/rollback lost	Stop or contract; full re-admission.
Expiry reached	Expire automatically; renewal proof required.

HISTORICAL TRUTH Impairment preserves the historical trial result while ending its use as current operational justification.

15. Decision outcomes and public claims

The verifier reports evidence; customer governance admits and grants actual authority.

Outcome	Meaning	Maximum next step
PASS	All gates and Alpha threshold satisfied.	Governance may consider bounded admission.
NARROW PASS	Only a reduced scope is supported.	Admit only the named reduced envelope.
CONDITIONAL	Conditions remain before current use.	Remediate and re-check conditions.
FAIL	Gate, Alpha, or critical-failure requirement not met.	No earned claim; preserve failure receipt.
INSUFFICIENT EVIDENCE	Inference not justified.	Acquire evidence or narrow the claim.

- Use exact scope and expiry in public wording.
- State verifier level; reserve independently proven for 13/14 absent documented equivalent.
- Never imply universal ASI, guaranteed Alpha, or authority beyond the envelope.

16. Conformance checklist

No earned claim is released until every applicable control has an affirmative, evidenced answer.

Control	Required evidence	Result
Mission compiled	Constitution id/hash; evaluator; exclusions	PASS / FAIL
Baselines fair	Reproduced incumbent and relevant AI Beta	PASS / FAIL
Evidence fresh	Commitment, custody, overlap analysis	PASS / FAIL
Release exact	Manifest, hashes/fingerprints, restore test	PASS / FAIL
Verifier adequate	Level, conflicts, competence, signatures	PASS / FAIL
Hard gates pass	Critical failures, safety, economics	PASS / FAIL
Alpha positive	LCB spread less C/R/H/I/D above threshold	PASS / FAIL
Receipt complete	Scope, validity, impairment, Chronicle	PASS / FAIL
Governance separate	Admission and actual authority decision	PASS / FAIL

This document specifies a proposed target institution and operating standard. It does not certify a deployment, prove an exact release, guarantee Mission Alpha, or grant production authority. Customer-specific capability, Specialist ASI status, portability, Alpha, safety, and authority are earned claims that require the tests defined here. Conceptual imagery is editorial visualization, not a photograph of deployed infrastructure or evidence of capability.

[Definitive corporate white paper](#)

REFERENCE ARCHITECTURE & CONTROL-PLANE SPECIFICATION

Trust boundaries, deterministic interfaces, receipts, fail-closed controls, and continuity tests

IMPLEMENTATION TARGET The durable mission institution sits between replaceable cognition and consequential action. Every boundary crossing carries identity, release, policy, proof currency, authority, provenance, and an auditable decision.

26 August 2026 | MONTREAL.AI | Montreal, Quebec, Canada

INSTITUTIONAL SERIES

Contents and conformance profile

Implementations may vary internally. A conforming system preserves the constitutional boundaries, receipts, failure behavior, and customer continuity defined here.

This document specifies a proposed target institution and operating standard. It does not certify a deployment, prove an exact release, guarantee Mission Alpha, or grant production authority. Customer-specific capability, Specialist ASI status, portability, Alpha, safety, and authority are earned claims that require the tests defined here. Conceptual imagery is editorial visualization, not a photograph of deployed infrastructure or evidence of capability.

ARCHITECTURE / 01

1. Canonical identifiers and state machine

No request crosses a boundary without resolvable identity and current state.

Identifier	Binds
customer_id	Legal/operating customer authority root
mission_id	Mission Constitution and version
institution_id	Persistent customer-owned institutional identity
release_id	Exact frozen candidate manifest
proof_receipt_id	Proof tuple and current validity
authority_envelope_id	Customer-granted permissions and expiry
event_id	Chronicle ordering and integrity
successor_id	Lineage without inherited proof/authority

STATE MACHINE Architecture -> candidate -> frozen release -> proof result -> governance admission -> bounded deployment -> impairment/renewal/retirement. Forbidden transitions fail closed.

2. Planes and trust boundaries

Six planes separate evidence, learning, proof, policy, action, and institutional memory.

Plane	System of record	May change serving behavior?	Boundary law
Evidence	Governed vault, bindings, provenance	No	Content is evidence, never authority.
Foundry/learning	Candidates, experiments, Gym receipts	No	No production credentials or protected proof.
Proof	Protocol, protected evidence, verifier runtime	No	Cannot modify challenger or broaden mission.
Policy/control	Constitution, approvals, envelopes	Customer governance only	Candidate cannot write policy.
Action	Controller, tools, ephemeral credentials	Inside current envelope	Pre-action checks and post-action receipt.
Chronicle	Events, checkpoints, impairment, lineage	No direct action	History cannot manufacture proof.

MINIMUM REQUEST mission_id + release_id + principal + policy_version + authority_envelope_id + proof_receipt_id when required + timestamp + nonce + request_hash.

3. Universal Evidence Fabric

The Evidence Fabric preserves heterogeneity, rights, provenance, freshness, and adversarial status.

Service	Required interface
Ingest	Register source, time, owner/licence, integrity, type, sensitivity.
Transform	Record deterministic or model-assisted transformation and lineage.
Bind	Connect evidence to claims, programs, tests, and decisions.
Govern	Enforce access, residency, retention, deletion, legal hold, export.
Assess	Freshness, confidence, gaps, adversarial-content and contamination status.
Retrieve	Return evidence plus provenance and policy, never naked content.

- Evidence content is untrusted input to reasoning components.
- Prompt-like instructions inside evidence do not acquire control-plane authority.
- A rights or integrity change emits an impairment candidate event.

4. Mission Compiler

The Compiler converts intent into an executable, rejectable Mission Constitution.

Compiler input	Compiler output
Mission thesis	Observable states and outcomes
Constraints and exclusions	Machine-checkable policy conditions
Baseline hypothesis	Incumbent and relevant AI Beta plan
Evidence inventory	Rights/freshness gaps and acquisition plan
Risk appetite	Hard gates, critical failures, authority ceiling
Operating context	Population, tools, human roles, rollback
Economics	Utility function and C/R/H/I/D reserves

COMPILABILITY GATE Reject, narrow, or hold in research mode when evaluation, evidence rights, a safe test path, or rollback cannot be established.

5. Mission Pack SDK and AGI Jobs

The Mission Pack is the portable specification; an AGI Job is a sealed, evaluable work order.

Job field	Required content
objective/scope	Named outcome, exclusions, mission version
inputs/evidence	Admissible sources, rights, freshness
tools/resources	Access, budget, latency, rate, compute
roles/dependencies	Candidate role, upstream/downstream contracts
evaluation	Development evaluator and final verifier separation
constraints	Forbidden actions, hard gates, critical failures
acceptance	Evidence, threshold, dispute, expiry, rollback

MEMBRANE The job is an economic and constitutional membrane between competing agents and the customer mission - not a vague prompt.

6. WORLD program compartment

WORLD represents what the institution currently believes and how those beliefs can fail.

Submodule	Contract
State estimator	Typed observations -> versioned state + uncertainty
Transition/dynamics	State/action -> predicted next-state distribution
Causal hypothesis	Intervention/condition -> testable effect claim
Prediction	Context -> outcome distribution + calibration
Falsifier	Observation pattern -> claim severance event
Anomaly/failure	Residual/error -> incident and diagnostic route
Counterfactual	Intervention alternative -> bounded simulation result

- Every output cites evidence bindings, assumptions, program version, domain, and proof state.
- Prediction residuals are stored; contradiction creates visible falsification.
- World submodules do not grant authority.

7. POLICY program compartment

POLICY represents proposed action, alternatives, preconditions, and consequences before permission is evaluated.

Interface	Required fields
proposal	Action class, target, parameters, rationale
preconditions	World-state predicates and evidence freshness
alternatives	At least one feasible alternative or abstention rationale
constraints	Applicable prohibitions, approvals, resource limits
consequences	Expected outcome, uncertainty, externalities
reversibility	Rollback plan, checkpoint, recovery objective
request	Authority requested - never self-granted

SEPARATION POLICY proposes. The external Gateway decides whether the current Authority Envelope permits the request.

8. PROOF compartment

PROOF is governed by external receipts and stores what one frozen release demonstrated.

State	Behavior
empty	No current earned claim.
under_examination	Frozen release in protected proof; no production authority.
proven	Receipt valid inside named proof envelope.
narrow/conditional	Only reduced scope or explicit conditions supported.
impaired	Historical result retained; current use stopped.
expired	Validity ended automatically.
failed	Failure receipt preserved; no positive claim.

- The claimant cannot write receipt status.
- Proof binds the complete tuple and verifier signature.
- The compartment exposes maximum justifiable authority, not actual authority.

9. AUTHORITY compartment

AUTHORITY stores customer-granted permission separately from capability and proof.

Envelope dimension	Examples
mission/action	Observe, recommend, sandbox, reversible, consequential
data/tools	Named sources, APIs, devices, models, networks
targets	Systems, assets, accounts, counterparties, geography
resources	Funds, compute, rate, latency, time window
approvals	Human roles, separation of duties, multi-party consent
monitoring	Signals, thresholds, escalation, expiry
rollback	Method, checkpoint, owner, maximum recovery time

AUTHORITY LAW Actual authority = customer grant constrained by current proof and policy. It may be narrower than proof and may be zero.

10. Alpha Foundry Ω

The Foundry manufactures a Successor Manifold behind stable interfaces.

Responsibility	Required control
Generate	Neural, symbolic, solver, workflow, collective, or hybrid candidates.
Compete	Compare on mission utility and hard constraints.
Diversify	Preserve distinct elites across Alpha, safety, cost, transfer, sovereignty.
Trace	Lineage, components, evidence exposure, budgets, evaluator history.
Archive	Retain negative results, falsifiers, and retired modules.
Isolate	No protected proof evidence, final certification, or production credentials.

FAILURE MODE Premature convergence can erase safe or transferable alternatives. Diversity is an operational reserve.

11. Sovereign Mission Gym and Experience Foundry

The Gym forms capability; the Experience Foundry adapts scenarios to diagnosed weakness.

Environment contract	Required record
state/observation	Typed variables, partial observability, sensor error
actions/dynamics	Permitted actions, transition logic, conservation/invariants
termination/score	Success, failure, critical events, utility
difficulty	Stage, curriculum, shock, adversary, transfer
provenance	Source, generator, seed/configuration, validation
separation	Formation status; protected-proof exclusion

- Generated scenarios must be validated for solvability and mission relevance.
- Reward or observation shocks must map to explicit institutional hypotheses.
- Gym results remain formation evidence.

12. Exact-release service

The Freeze Service converts a mutable candidate into one reproducible proof object.

Manifest class	Examples
Cognition	Models, weights/endpoints, prompts, routing, sampling
Programs	WORLD/POLICY versions, schemas, tests, falsifiers
Tools	Adapters, dependencies, SBOM, tool contracts
State	Memory/checkpoint, authorized writable classes
Control	Policies, permissions, budgets, rate limits
Recovery	Rollback checkpoint, restore test, owner
Integrity	Hashes, signatures, timestamp, behavioral fingerprint

MATERIAL CHANGE Anything outside an explicitly frozen adaptive envelope creates a new release identity.

13. Independent Proof Network

The Proof Network examines one frozen release against fresh protected evidence.

Conceptual plate: receipts arrive from separated directions; the claimant remains a distinct object.

Service	Control
Protocol registry	Precommit mission, baseline, metrics, gates, analysis.
Evidence custody	Protect samples, access, overlap, contamination.
Verifier runtime	Restore frozen release; execute controlled trial.
Receipt authority	Sign pass, narrow, conditional, failure, insufficient-evidence.
Conflict registry	Funding, governance, reporting, custody, incentives.

ARCHITECTURE / 14

14. External Policy Gateway

The Gateway is the mechanical decision point between requested and permitted action.

1. Authenticate principal, institution, mission, and release.
2. Resolve current proof receipt and impairment state.
3. Load customer policy and current Authority Envelope.
4. Evaluate target, tool, data, resources, approvals, time, and reversibility.
5. Deny, narrow, require approval, or permit.
6. Issue a signed decision receipt and Chronicle anchor.

FAIL-CLOSED Missing identity, stale proof, ambiguous policy, expired envelope, or unavailable rollback produces denial or contraction.

15. Production Deployment Controller

The Controller brokers production effects; candidates receive no standing production secrets.

Pre-action check	Failure behavior
Identity/release	Deny unknown or mismatched release.
Proof currency	Contract to still-valid action or deny.
Policy/approval	Deny absent or conflicting authorization.
Resources	Clamp rate, budget, scope, or time.
Reversibility	Deny reversible-action class if rollback unavailable.
Target/tool	Allowlist; issue ephemeral least-privilege credentials.

- Capture request hash, decision, tool/target, response hash, outcome link, approval, and Chronicle anchor.
- Bind observed outcome later to close the action loop.

16. Live Chronicle

The Chronicle is an append-only institutional memory, not an autobiography and not proof by itself.

Event family	Examples
Evidence	Ingest, transformation, rights/freshness change
Cognition	Hypothesis, program version, prediction, residual, falsification
Formation	Job, Gym stage, candidate lineage, failure
Proof	Freeze, protocol, trial, receipt, conflict, replication
Governance	Admission, envelope, approval, exception
Action	Decision, tool call, outcome, human intervention
Continuity	Incident, rollback, impairment, renewal, succession

INTEGRITY Signed ordering, checkpoints, retention, deletion, legal hold, and access must be governed. Raw evidence remains in the appropriate vault.

17. Boundary receipts and event schemas

Every boundary crossing is attributable, replayable, and testable without exposing protected evidence.

Receipt	Minimum fields
request	mission, release, principal, policy, envelope, proof, timestamp, nonce, hash
decision	allow/deny/narrow/approval, rule ids, reason, signature
action	tool, target, parameters hash, credential id, response hash
outcome	observed effect, delay, uncertainty, evaluator, evidence link
impairment	trigger, dependent claims, contraction, owner, return path
succession	parent/descendant lineage, inherited assets, empty proof/authority confirmation

PRIVACY Receipts should carry hashes and governed references where raw content is unnecessary.

18. Security, safety, and resilience

The control plane assumes compromise, drift, and supplier failure will occur.

Threat	Required control
Prompt/data injection	Treat content as untrusted; typed parsers; tool isolation; policy externalization.
Proof leakage	Separate custody; canaries; access logs; contamination response.
Supplier change	Pin/fingerprint; detect drift; contract authority; substitute/re-prove.
Credential theft	Ephemeral least privilege; target binding; rate/spend limits.
Chronicle tampering	Append-only signatures, checkpoints, independent retention.
Verifier compromise	Conflict registry, replication, revocation, reconstitution.
Rollback failure	Drills, recovery objectives, stop authority, alternate path.

RESILIENCE LAW Preserve demonstrated function through substitution, but never transfer proof automatically to a changed release.

19. Deployment patterns and portability

Portability is named by level and demonstrated through a customer-controlled test.

Level	Outcome
P0	Managed service only; no complete institutional export.
P1	Evidence, policy, memory, and Chronicle export.
P2	Portable mission runtime with documented supplier interfaces.
P3	Customer-controlled deployment and keys; substitution tested.
P4	Mission-appropriate disconnected/sovereign operation with approved local components.

1. Verify release and dependency manifest.
2. Restore in the target environment.
3. Reconnect permitted evidence and tools.
4. Substitute at least one declared replaceable supplier.
5. Reproduce reference tests.
6. Confirm equivalent policy boundaries and Chronicle continuity.

20. Acceptance, maturity, and release gate

A subsystem progresses by evidence, not presentation quality.

Maturity	Required evidence
Specified	Interfaces, invariants, threat model, acceptance criteria.
Prototyped	Executable control path demonstrates intended behavior.
Validated	Reproducible representative tests meet predeclared criteria.
Independently evaluated	Separated verifier reproduces material claims.
Production-admitted	Customer governance grants bounded envelope with monitoring/recovery.

- Boundary tests fail closed.
- Receipt schemas validate and replay.
- Identity/release mismatches deny.
- Proof expiry and drift contract authority.
- Rollback and export/rebuild pass at the claimed level.
- All images and interfaces preserve the claim-state distinctions.

This document specifies a proposed target institution and operating standard. It does not certify a deployment, prove an exact release, guarantee Mission Alpha, or grant production authority. Customer-specific capability, Specialist ASI status, portability, Alpha, safety, and authority are earned claims that require the tests defined here. Conceptual imagery is editorial visualization, not a photograph of deployed infrastructure or evidence of capability.

07 / GRAND FINAL INSTITUTIONAL SERIES

MISSION UNDERWRITING & DEPLOYMENT PLAYBOOK

A 16-page operating sequence from mission thesis to monitored, reversible authority

EXECUTIVE OPERATING PLAYBOOK Underwrite a bounded proof trajectory - not generalized autonomy. Separate build capital, proof capital, admission, production authority, and renewal so each decision can stop without corrupting the next.

26 August 2026 | MONTREAL.AI | Montreal, Quebec, Canada

INSTITUTIONAL SERIES

Contents, roles, and decision rights

One accountable sponsor owns the mission outcome; separate owners govern evidence, proof, policy, security, deployment, and independent verification.

Stage 0. Select the mission.....3

Stage 1. D0 underwrite.....4

Stage 2. Compile the Constitution.....5

Stage 3. Prepare evidence.....6

Stage 4. Establish baselines.....7

Stage 5. Manufacture and teach.....8

Stage 6. Candidate readiness.....9

Stage 7. Freeze the release.....10

Stage 8. Run independent proof.....11

Stage 9. Determine Alpha and admit.....12

Stage 10. Grant bounded authority.....13

Stage 11. Deploy and roll back.....14

Stage 12. Monitor and impair.....15

Stage 13. Renew, succeed, or retire.....16

Stage 14. Board packet and 90-day launch.....17

Role	Cannot also control
Mission sponsor	Final verifier judgment
Foundry lead	Protected proof evidence
Gym lead	Final proof issuance
Verifier owner	Candidate modification
Policy owner	Candidate self-authorization
Deployment owner	Silent scope expansion

DEPLOYMENT PLAYBOOK / 01

Stage 0. Select one mission

Choose a mission where value, evidence, and failure can be observed inside a bounded proof horizon.

Selection lens	Executive test
Strategic value	A measurable outcome matters to the customer.
Baseline	Incumbent and relevant AI Beta are reproducible.
Evidence	Rights, provenance, and fresh evaluation path exist.
Safety	A sandbox/shadow path and stop conditions are credible.
Reversibility	Actions can begin at A0-A2; rollback is designable.
Learning value	Failure produces reusable evidence or Chronicle value.

AVOID Missions with unobservable success, undefined accountability, irreversible first actions, or no credible independent evaluator.

DEPLOYMENT PLAYBOOK / 02

Stage 1. D0 underwrite

Decide whether the opportunity justifies proof capital before building a large system.

Underwriting question	Required answer
Value at stake	Gross value, downside, time horizon, beneficiaries.
Mission utility	Outcome measure plus hard non-substitutable constraints.
Proof capital	Budget for fresh evidence, verifier, replication, tail tests.
Risk capital	Loss limits, risk reserve, recovery and insurance assumptions.
Competitive baseline	Better of incumbent and relevant AI Beta.
Ownership target	Required rights, portability level, substitution test.

D0 DECISION PASS to compile; NARROW the mission; hold as RESEARCH; or REJECT. Do not approve production autonomy at D0.

DEPLOYMENT PLAYBOOK / 03

Stage 2. Compile the Mission Constitution

Translate ambition into observable, enforceable, rejectable mission law.

- 1. Name sponsor, accountable owner, mission population, and exclusions.
- 2. Define observable states, outcomes, utility, time horizon, and baselines.
- 3. Specify permitted/prohibited actions, hard gates, critical failures, and human approvals.
- 4. Define evidence plan, evaluator, proof level, and fresh-evidence mechanism.
- 5. Set authority ceiling, rollback, monitoring, expiry, and succession rules.

Compiler result	Next step
COMPILED	Proceed to evidence readiness.
PARTIAL	Resolve named gaps; no Foundry scale.
RESEARCH-ONLY	Explore without earned claims/production authority.
REJECTED	Stop or select another mission.

Stage 3. Prepare evidence and rights

Make every material input usable, attributable, exportable to the promised level, and removable when required.

Workstream	Deliverable
Inventory	Sources, owners, systems, formats, sensitivity.
Rights	Ownership/licence/consent, residency, retention, deletion.
Quality	Coverage, missingness, label quality, bias, freshness.
Integrity	Hashes/signatures, acquisition time, transformation lineage.
Security	Threat model, prompt/data injection controls, access tiers.
Proof separation	Training/Gym versus protected-evidence custody.

D1 EVIDENCE GATE No scalable Foundry work until rights, provenance, quality, security, and protected-proof separation are adequate.

Stage 4. Establish baseline integrity

Reproduce both the incumbent and relevant AI Beta under comparable conditions.

- Version procedures, people roles, tools, models, prompts, costs, latency, and human support.
- Use the same mission utility, information budget, constraints, and operating conditions.
- Document unavoidable asymmetries and sensitivity tests.
- Refresh the relevant AI Beta before proof if the rentable frontier moves materially.

Baseline artifact	Owner
Incumbent runbook and replay	Mission operations
Relevant AI Beta configuration	Technical evaluation
Utility and hard-gate calculator	Mission underwriting
Fairness and information-budget memo	Verifier liaison
Baseline freeze receipt	Independent recorder

DEPLOYMENT PLAYBOOK / 06

Stage 5. Manufacture candidates and teach

Build a diverse candidate manifold; use the Gym to expose weakness without contaminating proof.

Foundry action	Control
Generate	Multiple architectures and suppliers behind stable interfaces.
Evaluate	Development metrics plus hard-gate diagnostics.
Diversify	Retain elites for safety, cost, Alpha, transfer, sovereignty.
Stress	Rare events, shocks, adversaries, constraint collisions.
Trace	Lineage, data exposure, program versions, budgets.
Separate	No protected proof cases or production credentials.

FORMATION ONLY A Gym result can justify more development. It cannot justify an independently proven or production-authorized claim.

Stage 6. Candidate readiness

Select one candidate only when its known failures, reproducibility, and control interfaces are decision-ready.

Readiness check	Pass evidence
Mission tests	Unit, integration, replay, stress, transfer.
Program inspection	Evidence, assumptions, predictions, falsifiers, uncertainty.
Control integration	Policy Gateway and Controller paths tested.
Failure disclosure	Known limitations, critical events, archived alternatives.
Recovery	Checkpoint, rollback, restore drill.
Reproduction	Clean environment produces expected development results.

D2 ENTRY Readiness permits freeze and independent examination only. It does not confer Specialist ASI, Alpha, or authority.

DEPLOYMENT PLAYBOOK / 08

Stage 7. Freeze the exact release

Seal the entire claim-bearing object and stop learning before proof.

1. Bind models/endpoints, prompts, routing, programs, tools, dependencies, policies, memory, budgets, permissions, and rollback.
2. Hash what is available; fingerprint and date opaque suppliers.
3. Define any authorized in-trial learning rule, writable state, budget, invariants, and monitoring.
4. Reproduce the release in the verifier environment.
5. Sign the manifest and Chronicle freeze event.

INVALIDATION An unauthorized change, unpinned dependency, or hidden learning path creates a new release and restarts proof.

DEPLOYMENT PLAYBOOK / 09

Stage 8. Run independent fresh proof

Move execution and protected evidence outside claimant control.

Conceptual plate: independent receipts arrive from separated custody domains.

1. Precommit mission, baseline, metrics, hard gates, protocol, statistics, and verifier.
2. Confirm evidence freshness, overlap analysis, and custody.
3. Execute with fixed tools, budgets, latency, retries, and human-assistance rules.
4. Record point results, confidence bounds, critical failures, cost, burden, and deviations.
5. Reproduce or cross-check material findings.
6. Issue a signed proof, narrow, conditional, failure, or insufficient-evidence receipt.

Stage 9. Determine Alpha and admit

Convert proof results into an economic claim, then let customer governance decide actual authority.

Decision layer	Question	Output
Proof	What did this exact release demonstrate?	Receipt and maximum justifiable boundary
Underwriting	What net remainder survives C/R/H/I/D?	Mission Alpha present/absent and expiry
Governance	What should the customer permit now?	Authority Envelope, possibly narrower or zero
Operations	Can the control path deploy safely?	Deployment readiness or hold

SEPARATE DECISIONS A proof pass does not grant authority. A positive Alpha result does not require the customer to deploy.

Stage 10. Grant bounded authority

Begin with the least consequential level that realizes value and preserves learning.

Envelope field	Decision
Subject	Exact institution, mission, frozen release.
Actions/targets	Permitted, approval-required, prohibited.
Resources	Data, tools, funds, compute, rate, time.
Proof conditions	Current receipt, scope, expiry, environment.
Monitoring	Signals, thresholds, escalation, accountable owner.
Rollback	Method, checkpoint, owner, maximum recovery time.
Suspension	Automated and human kill-switch authority.

AUTHORITY PRINCIPLE Grant only what is both justified by current proof and chosen by customer governance.

Stage 11. Deploy, observe, and prove rollback

Route every consequential action through the Gateway and Controller.

- 1. Start at A0/A1 or shadow mode where feasible.
- 2. Verify identity, release, proof currency, policy, approvals, resources, and reversibility before action.
- 3. Issue ephemeral least-privilege credentials only after approval.
- 4. Capture signed decision and action receipts.
- 5. Bind observed outcomes to predictions and update residuals.
- 6. Drill stop, rollback, restore, and Chronicle recovery.

Deployment gate	Failure outcome
Monitoring unavailable	No consequential action.
Rollback unavailable	No reversible-action authority.
Proof stale/expired	Contract to still-valid scope or stop.
Release mismatch	Deny and investigate.
Chronicle unavailable	Fail closed for governed action.

Stage 12. Monitor Alpha and impairment

Live operation continuously compares the proven distribution with current reality.

Signal	Response
Performance/ calibration drift	Contract affected claim; targeted re-proof.
Baseline improvement	Re-underwrite against current AI Beta.
Cost or human burden rise	Recompute net Alpha.
Critical failure/prohibited action	Stop, preserve evidence, incident, full re-admission.
Supplier/configuration change	New release or equivalence analysis.
Expiry	Automatic claim and authority expiry.

NO AUTO-RECOVERY A metric returning to normal does not silently restore authority. Renewal requires evidence and governance.

Stage 13. Renew, succeed, or retire

Use Chronicle memory to improve descendants without letting lineage inherit proof or power.

Conceptual plate: knowledge compartments illuminate in the descendant while proof and authority remain empty.

Path	Requirement
Renew same release	Fresh/targeted proof against current reality; new validity.
Material descendant	Separate learning branch; freeze; fresh proof; separate admission.
Supplier substitution	Reference tests and equivalent bounded behavior; re-proof proportionate to change.
Retire	Revoke authority, preserve Chronicle, archive receipt and recovery state.

DEPLOYMENT PLAYBOOK / 15

Stage 14. Board packet and 90-day launch

A disciplined first mission can be launched as a bounded evidence program.

Days	Board-visible deliverable
0-15	Mission thesis, sponsor, baseline hypothesis, exclusions, value at risk.
16-30	Compiled Constitution, evidence/rights map, proof-capital budget.
31-45	Baseline reproduction, threat model, safe test and rollback plan.
46-70	Foundry/Gym evidence, candidate readiness, freeze proposal.
71-90	Independent proof readiness review or documented stop/narrow decision.

- Approve D0-D4 as separate resolutions.
- Require a failure receipt to count as a valid risk-reduction outcome.
- Reserve public claims until receipt scope and verifier level are approved.
- Use the workbook as the board packet index.

This document specifies a proposed target institution and operating standard. It does not certify a deployment, prove an exact release, guarantee Mission Alpha, or grant production authority. Customer-specific capability, Specialist ASI status, portability, Alpha, safety, and authority are earned claims that require the tests defined here. Conceptual imagery is editorial visualization, not a photograph of deployed infrastructure or evidence of capability.

08 / GRAND FINAL INSTITUTIONAL SERIES

MISSION CONSTITUTION WORKBOOK

Editable customer instrument for underwriting, proof, authority, ownership, and succession

CUSTOMER COMPLETION INSTRUMENT Complete one mission at a time. The workbook turns executive intent into a bounded, testable, customer-controlled constitution that can stop, narrow, prove, admit, monitor, and renew.

26 August 2026 | MONTREAL.AI | Montreal, Quebec, Canada

INSTITUTIONAL SERIES

How to use this workbook

Complete the fields in sequence. Do not fill gaps with optimistic prose: mark unknowns, assign owners, and stop at the relevant gate.

Step	Action
1	Executive sponsor completes mission and value fields.
2	Evidence, risk, technical, legal, and operations owners validate their sections.
3	Verifier owner reviews proof design without receiving claimant control.
4	Customer governance signs D0-D4 separately.
5	Every material revision creates a version and Chronicle event.

Decision field	Customer response
Institution / customer	{{CUSTOMER_NAME}}
Mission Constitution ID	{{MISSION_ID}}
Version	{{CONSTITUTION_VERSION}}
Executive sponsor	{{EXECUTIVE_SPONSOR}}
Accountable mission owner	{{MISSION_OWNER}}
Target decision date	{{DECISION_DATE}}

FIELD RULE Use "UNKNOWN - owner - resolution date" instead of asserting certainty.

WORKBOOK / 01

Worksheet 1. Mission thesis and boundary

State the mission so a neutral evaluator can tell what is inside, outside, successful, and failed.

Decision field	Customer response
Mission name	{{MISSION_NAME}}
One-sentence mission thesis	{{MISSION_THESIS}}
Decision or outcome to improve	{{TARGET_OUTCOME}}
Population / operating domain	{{MISSION_POPULATION}}
Explicit exclusions	{{MISSION_EXCLUSIONS}}
Time horizon	{{MISSION_HORIZON}}

Executive prompts

- Why does this outcome matter now?
- What should remain customer-controlled when suppliers change?
- What is the maximum acceptable authority even after proof?

Worksheet 2. Outcomes, utility, and baselines

Define comparable performance before candidate work begins.

Decision field	Customer response
Primary outcome metric	{{PRIMARY_METRIC}}
Hard constraints / non-substitutable gates	{{HARD_GATES}}
Incumbent identity and configuration	{{INCUMBENT_BASELINE}}
Relevant AI Beta identity and configuration	{{AI_BETA_BASELINE}}
Comparable information / tool / human budget	{{COMPARABLE_BUDGET}}
Mission Alpha threshold	{{ALPHA_THRESHOLD}}

BASELINE LAW The operative baseline is the better of the incumbent and relevant AI Beta.

Worksheet 3. Evidence and rights

Bind every material input to provenance, rights, freshness, and permitted use.

Decision field	Customer response
Evidence sources and owners	{{EVIDENCE_SOURCES}}
Ownership / licence / consent	{{EVIDENCE_RIGHTS}}
Sensitivity / residency / retention	{{EVIDENCE_GOVERNANCE}}
Known gaps / missingness / bias	{{EVIDENCE_GAPS}}
Fresh proof evidence mechanism	{{FRESH_EVIDENCE}}
Protected evidence custodian	{{EVIDENCE_CUSTODIAN}}

INJECTION CONTROL Evidence content is untrusted input. It cannot instruct the policy, proof, or deployment control planes.

Worksheet 4. Risk, constraints, and human accountability

Specify what may never be traded against average performance.

Decision field	Customer response
Prohibited actions	{{PROHIBITED_ACTIONS}}
Critical failures and budgets	{{CRITICAL_FAILURES}}
Named accountable humans	{{ACCOUNTABLE_HUMANS}}
Required approvals / separation of duties	{{APPROVALS}}
Maximum loss / risk reserve	{{RISK_RESERVE}}
Stop and escalation conditions	{{STOP_CONDITIONS}}

HARD GATE A prohibited action or disqualifying critical failure can dominate aggregate utility.

Worksheet 5. Proof plan

Precommit how one exact frozen release will be examined outside claimant control.

Decision field	Customer response
Required independence level (I0-I4)	{{INDEPENDENCE_LEVEL}}
Verifier identity / selection process	{{VERIFIER}}
Protocol hash / approval owner	{{PROTOCOL_OWNER}}
Metrics / confidence method	{{PROOF_METRICS}}
Tail and counterexample tests	{{TAIL_TESTS}}
Validity / expiry / impairment triggers	{{PROOF_VALIDITY}}

PUBLIC CLAIM Use I3/I4 for public "independently proven" claims unless a documented equivalent is approved and disclosed.

Worksheet 6. Mission Alpha underwriting

Estimate opportunity honestly; admit only the remainder that survives proof and deductions.

Decision field	Customer response
Gross utility difference / spread thesis	{{SPREAD_THESIS}}
C - operating / integration / switching cost	{{DEDUCTION_C}}
R - mission risk reserve	{{DEDUCTION_R}}
H - incremental human burden	{{DEDUCTION_H}}
I - imitation / commoditization reserve	{{DEDUCTION_I}}
D - drift / impairment reserve	{{DEDUCTION_D}}
Net Alpha decision rule	{{NET_ALPHA_RULE}}

NO GUARANTEE Mission Alpha may be absent. A rigorous failure receipt is a valid capital-allocation outcome.

Worksheet 7. Authority Envelope

Translate customer governance into machine-enforceable limits.

Decision field	Customer response
Maximum authority level (A0-A4)	{{AUTHORITY_LEVEL}}
Permitted data / tools / actions / targets	{{PERMITTED_SCOPE}}
Approval-required actions	{{APPROVAL_REQUIRED}}
Monetary / compute / rate / time limits	{{RESOURCE_LIMITS}}
Monitoring signals and thresholds	{{MONITORING}}
Absolute and event-driven expiry	{{AUTHORITY_EXPIRY}}
Kill-switch actors	{{KILL_SWITCH}}

AUTHORITY LAW Proof establishes a ceiling; customer governance may grant less or nothing.

Worksheet 8. Deployment, rollback, and Chronicle

Prove the operational control path before consequential action.

Decision field	Customer response
Deployment owner / environment	{{DEPLOYMENT_OWNER}}
Pre-action checks	{{PRE_ACTION_CHECKS}}
Rollback method / checkpoint	{{ROLLBACK_METHOD}}
Maximum recovery time	{{RECOVERY_TIME}}
Incident and escalation route	{{INCIDENT_ROUTE}}
Chronicle retention / access / integrity	{{CHRONICLE_CONTROL}}
Rollback drill evidence / date	{{ROLLBACK_DRILL}}

DEPLOYMENT GATE No consequential action without current proof, policy, monitoring, rollback, and named accountability.

Worksheet 9. Ownership, portability, and succession

Define what the customer owns, what remains licensed, and how continuity is tested.

Decision field	Customer response
Customer-owned artifacts	{{OWNED_ARTIFACTS}}
Licensed / open-source / excluded artifacts	{{RIGHTS_BOUNDARY}}
Claimed portability level (P0-P4)	{{PORTABILITY_LEVEL}}
Supplier substitution target	{{SUBSTITUTION_TARGET}}
Export-and-rebuild test owner	{{REBUILD_OWNER}}
Equivalent bounded-behavior criteria	{{EQUIVALENCE_TEST}}
Successor inherited memory assets	{{INHERITED_MEMORY}}

SUCCESSION LAW Descendants may inherit memory and lineage. Proof status and production authority restart empty.

Worksheet 10. Decision record and signatures

Record each gate independently so build momentum cannot manufacture proof or authority.

Gate	Decision	Evidence / conditions	Accountable signature
D0 Underwrite	{{D0_DECISION}}	{{D0_EVIDENCE}}	{{D0_SIGNATURE}}
D1 Build	{{D1_DECISION}}	{{D1_EVIDENCE}}	{{D1_SIGNATURE}}
D2 Prove	{{D2_DECISION}}	{{D2_EVIDENCE}}	{{D2_SIGNATURE}}
D3 Admit	{{D3_DECISION}}	{{D3_EVIDENCE}}	{{D3_SIGNATURE}}
D4 Renew/retire	{{D4_DECISION}}	{{D4_EVIDENCE}}	{{D4_SIGNATURE}}

Decision field	Customer response
Final Mission Constitution hash	{{FINAL_CONSTITUTION_HASH}}
Frozen release ID (when applicable)	{{FINAL_RELEASE_ID}}
Proof receipt ID (when applicable)	{{FINAL_PROOF_RECEIPT}}
Authority Envelope ID (when applicable)	{{FINAL_AUTHORITY_ID}}
Next review / expiry	{{NEXT_REVIEW}}

This document specifies a proposed target institution and operating standard. It does not certify a deployment, prove an exact release, guarantee Mission Alpha, or grant production authority. Customer-specific capability, Specialist ASI status, portability, Alpha, safety, and authority are earned claims that require the tests defined here.
